

# SOP-12: Exact Campaign Operations

Version 2.1 · 2026-08-10 · Owner: PPC Lead · Amends v2.0 (2026-07-26) by adding Element 11 (Operator ramp) and Element 12 (Interface contracts); Sections 1 to 10 carry forward unchanged · Thresholds live in the Master PPC Decision Criteria System v4.0 only; this SOP carries zero local thresholds

## 1. Verdict and Scope

**VERDICT:** Exact campaigns are the control instrument of the account, carrying the 55-60% match-type spend destination of the M6 structure targets and 100% of funded ranking pushes, which makes this the highest-frequency SOP in the 39-component set. Version 2.0 expanded v1.0 from 8 procedures to 12, from a 14-row verdict mapping to the full 25-verdict closed vocabulary, from 1 worked example to 3, and from 6 failure modes to 10, and corrected the v1.0 taper worked example to M3 step compliance. Version 2.1 adds the two elements v2.0 lacked: the operator ramp that transfers this document to a person, and the interface contracts that state what happens when a handoff does not arrive. This SOP governs the entire operating life of both exact structure classes: creation, launch settings, the weekly operating pass, intraday funded-push pacing, verdict execution at campaign level, taper execution, promotion and demotion between classes, duplicate consolidation, event-window overlays, variation re-points, and pause and archive mechanics.

### 1.1 The Two Structure Classes

Every exact keyword in the account lives in exactly one of two classes, and the class determines which creation procedure, budget treatment, and review depth applies. Class 1 - single-keyword oversight campaigns: one campaign, one keyword, for every term carrying the oversight flag per v4.0 (the roughly 100 terms per product driving over 90% of results). This class holds every funded push, every discovered floor, and every dedicated defense. Class 2 - consolidated syntax-exact tail campaigns: one campaign per syntax family, 5-20 terms per ad group, per-term bids, for exact terms below the oversight bar. The family is the cap-enforcement unit; a consolidated campaign never straddles two syntax families. Movement between classes is governed by P5 (promotion) and P6 (demotion) and fires only on the oversight criteria defined in v4.0, never on judgment.

### 1.2 The Four Legitimate Duplicate Roles

The registry permits the same term to run in 2+ live exact instances only when each instance carries one declared distinct role per Doctrine 5.2: stage-stack (a hot Ranking exact and a cool Conversions exact running simultaneously per O4, each tagged and budgeted separately), placement-split (instances isolating placement groups per #28 evidence), variation-split (instances advertising different child SKUs per the D2 map), and sibling ownership (instances on different family products per the declared S-F3 term owner and role assignments). Any second instance without one of these four roles declared in T3 is P7 territory the day it is found.

### 1.3 Boundaries With Adjacent SOPs

| Adjacent component             | The seam, stated so it is owned                                                                                                                                                                 |
|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Criteria System v4.0           | Decides every verdict, threshold, band, scenario, and limit. This SOP executes; it never decides. A threshold appearing in this SOP instead of v4.0 is a defect.                                |
| #31 Budget and envelope        | Decides which pushes get funded (M5 queue) and every envelope-level budget verdict (CAP SYNTAX, envelope raises and cuts). This SOP receives resulting budget deltas and never originates them. |
| #30 Harvest and graduation     | Decides which terms graduate into exact. This SOP receives GRADUATE FROM DISCOVERY as an input and executes P1/P2 the same day.                                                                 |
| #29 Negation architecture      | Owns negation doctrine, wall rules, and the wall audit. This SOP builds the prescribed walls at every structure event, in the same working session, per #29 rules.                              |
| #28 Placement and bid-modifier | Owns placement-level analysis, ladder step derivation, exit-bid discovery, and modifier sizing. This SOP executes the resulting campaign-level bid and modifier steps.                          |
| #38 Bulk-file mechanics        | Owns pull, staging format, upload, and the T+1 verification pass. This SOP produces staged change sets in #38 format and consumes its verification report.                                      |
| #22 Launch-stage PPC           | Owns the deployment sequence and honeymoon handling. This SOP governs steady-state operation from the moment a campaign exits launch handling per the launch-to-KDR handoff map.                |
| #32 Deal and event window      | Owns the event plan, ramp, caps, and reconciliation. This SOP freezes structure changes inside armed windows (P9) and executes only what the event plan names.                                  |
| #33 Sibling arbitration        | Owns composite computation and ownership declaration on shared terms. This SOP checks the declared owner (G11) before any scale action on a shared term.                                        |
| #17-19 SB / SBV / SD           | Own the non-SP formats. On ENTER SBV ARBITRAGE, this SOP executes only the SP-exact ladder step-down; the SBV build belongs there.                                                              |

## 2. Trigger Conditions

| Trigger                   | Signal                                                                                | Procedure invoked                                                                                                  |
|---------------------------|---------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| Weekly cadence            | Monday audit cascade reaches T2; exact rows in the OVERSIGHT filter view              | P3 weekly operating pass; deployment Tuesday per #38                                                               |
| Graduation arrival        | #30 issues GRADUATE FROM DISCOVERY on a term, same day                                | P1 or P2 (class per v4.0 oversight criteria) + #29 walls, same session                                             |
| Structure verdict         | ADD EXACT + RESTRUCTURE, CONSOLIDATE DUPLICATES, TAPER, PAUSED-PENDING assigned in T2 | P1/P2, P7, P4, P8 respectively                                                                                     |
| Funding release           | M5 queue entry moves to FUNDED with a dated release                                   | P1 push stand-up (or bid and budget lift on the existing dedicated campaign), same day as release; P12 pacing arms |
| Class boundary crossing   | Oversight flag gained or lost on a term (criteria per v4.0)                           | P5 promotion / P6 demotion                                                                                         |
| Event window              | G12 arms on a confirmed deal window touching the product                              | P9 event overlay; structure changes freeze unless the event plan names them                                        |
| Inventory band change     | G6 flips to YELLOW or RED on a targeted variation; D2 names the ranked backup         | P10 re-point same day on RED; push freeze on YELLOW per the verdict v4.0 issues                                    |
| Intraday, deployment days | Hourly truncation alarm on push campaigns during and after upload                     | P12 step 3; budget lever same day on breach                                                                        |
| Intraday, funded pushes   | Twice-daily in-budget % and spend-curve check on every FUNDED row                     | P12 steps 1-2                                                                                                      |
| Verification return       | #38 T+1 verification report flags a landed-value mismatch                             | F10 response: redeploy the delta same day                                                                          |

## 3. Preconditions and Gates

Every procedure below runs only after these preconditions read current in the packet manifest. A missing or stale field group suppresses the dependent execution class; the pass records what it could not see and continues on the rows it can.

| Precondition (manifest field group) | Requirement before any procedure runs                                                                                                                                                                                                                                                          |
|-------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| A2 Deployment state                 | Current bulk state in-row for the affected campaigns; stale state fails G2 freshness and the pass stops for those rows.                                                                                                                                                                        |
| A6 Objective + Expected CPC         | Every affected term carries exactly one declared objective; UNTAGGED routes to assignment per O2 before execution (G10). Expected CPC present on every rank-objective row.                                                                                                                     |
| A7 Eligibility                      | Advertised SKU eligible; an eligibility flip halts all execution for the target same day (G4) and opens the listing task.                                                                                                                                                                      |
| B1 Indexing and listing placement   | Rank-objective creations require the term indexed with title or bullet placement (G5); backend-only routes to the listing queue before any push funding.                                                                                                                                       |
| B5 Coverage counts                  | Registry counts per match type current, or promotion, consolidation, and creation-legality decisions are unreadable.                                                                                                                                                                           |
| B8 Economics chain                  | T0 named cells live (AOV, MarginPerOrder, BE_ACOS, TargetACOS, MaxAccACOS, ExpectedCPC); the G9 PROVISIONAL tag carries onto any ceiling-referencing action while margin is blended or stale.                                                                                                  |
| D2 Variation map                    | Targeted variation known for the term with the ranked-backup chain; if unmapped, the campaign points at the preferred SKU and the row carries the D2-pending flag.                                                                                                                             |
| Gates in force                      | G3: a truncated campaign gets the budget lever first, and no bid changes read through a truncated day. G6: inventory RED blocks push creation and push lifts. G11: shared-term scale actions check the declared family owner first. G12: active event mode freezes non-plan structure changes. |

## 4. Step-Level Procedures

### P1. Create a single-keyword exact campaign (oversight class)

1. Confirm class: the term carries the oversight flag in T2 (column K1). If not, use P2.
2. Confirm creation is legal: read T2 K8 (# Exact count) and the T3 registry. A live exact instance with no declared distinct role makes this P7 territory, not creation. A live instance with a declared role admits creation only when the new instance carries one of the four Section 1.2 roles, declared in T3 before the campaign exists.
3. Confirm gates: G6 GREEN on the D2-preferred variation (RED blocks creation on push verdicts), G12 clear or the event plan names this creation, G9

fresh where the driving verdict references a ceiling, and G5 passed on rank-objective terms.

4. Name the campaign per the v4.0 Section 4.2 convention (restated in Appendix A). The objective segment must parse, or T3 flags naming non-compliance and F6 fires.
5. Stage the campaign settings as bulk rows per #38: portfolio = the product's portfolio; daily budget = the T2 Required Budget \$/wk field for the term divided over 7 days; bidding strategy per v4.0 Section 4.4 for the declared objective.
6. One ad group. Advertised SKU = the D2-preferred variation for the term, never the parent by default.
7. Add the single keyword, match type Exact. Starting bid = the value the driving verdict carries (ladder start, discovered floor, or push sizing from T2 K7). The bid is never invented at creation time; a creation with no verdict-carried bid returns to T2 as incomplete.
8. Placement modifiers at creation = 0 on all three groups unless placement-level evidence for this term already exists per #28. The modifier is earned, not defaulted.
9. Build the negation walls in the same working session per #29: negative-exact this term in every phrase, broad, and auto campaign that could serve it, and in sibling campaigns per the declared family ownership. Record the wall list in the T3 row so the #29 wall audit has its baseline.
10. Update the registry: T2 K8 increments; new T3 row carries objective tag, role, owner, and wall list; T1 family spend formulas pick the campaign up automatically via the syntax tag.
11. Log the creation in T6 with the prediction the driving verdict carries: metric, direction, magnitude, horizon, and review date. A creation without a logged prediction is incomplete and does not deploy.
12. Deployment routes through #38: Tuesday by default; same day when the driving verdict carries a dated release (funded push, graduation). Same-day deployments still receive the full T+1 verification pass.

## **P2. Create or extend a consolidated syntax-exact campaign (tail class)**

1. One campaign per syntax family; never straddle families (the family is the cap-enforcement unit per v4.0 syntax caps). If the family campaign exists, extend it; create only when none exists.
2. Naming encodes the family root in the keyword position; Objective = the family's dominant tail objective (typically Conversions or Discovery-graduate). When the dominant objective shifts on a later read, the campaign retags per O7 as a logged transition, never silently.
3. Ad group size 5-20 terms. At 20, open a second ad group within the same campaign before opening a second campaign; a second campaign on the same family is an F4 condition.
4. Per-term bids set individually from each term's verdict-carried value. Consolidation shares budget and data, never a blanket bid.
5. Walls per #29 for every term added, same session, recorded in T3 exactly as P1 step 9.
6. Registry and T6 entries as in P1 steps 10-11; the prediction covers the added terms as a named cohort with one review date.

## **P3. Weekly operating pass (inside the Monday cascade)**

1. Enter T2 only after T0 and T1 have been read. Product posture and family caps govern everything below them; a T2 pass that skipped T0/T1 is invalid by construction.
2. Score last cycle first: the pass opens by reading the T6 rows whose review dates land this cycle and recording their V5 scores. Unsourced actions do not accumulate.
3. Apply the OVERSIGHT filter view. For each exact-relevant row, verify the gate columns before any metric read: G2 freshness, G3 truncation (K2), G6 inventory, G12 event. A failing gate executes the gate's lever (budget for G3) and defers the metric-driven verdict for that row to the next clean cycle.
4. Read the row's verdict (K9) and map it to campaign-level execution per the Section 5 table. Two rows with opposite trends never receive the same execution; the four-period trend context in the row travels with the staged change's reason string.
5. Apply the one-lever rule: one row receives one lever per cycle (bid or budget, never both) unless the verdict itself names a two-lever program, in which case the verdict text governs.
6. Expand campaign child rows on any keyword where the verdict names a specific campaign, and execute at that campaign, not across all instances. Multi-instance terms with declared roles receive the verdict only on the instance whose role the verdict addresses.
7. Stage every change as bulk rows per #38: entity, current value, new value, reason string carrying the verdict and scenario ID. A staged row missing its scenario ID does not deploy.
8. Tuesday: deploy per #38 after the BM huddle. T+1: the #38 verification pass confirms landed values; mismatches route to F10 same day.
9. Log every deployed change in T6 with its prediction; V5 scores at the named review dates per step 2 of the following cycles.

## **P4. Taper execution at rank achievement**

1. Trigger: TAPER verdict (rank achieved, hold confirmed per the v4.0 stability requirement). The taper trigger was logged the day the push objective was set; execution is not a judgment call, and a rank-achieved row still carrying push spend is the F5 condition.
2. Execute the dated ladder steps from #28: bid step-downs at the M3 step size on the named dates toward the placement-CPC exit bid; modifier step-downs where modifiers were raised for the push.
3. Normalize the daily budget toward maintenance as spend falls. Budget follows the bid down, never leads it down, so each step reads cleanly.
4. Retag the objective from Ranking to Conversions (or Defensive where the term is brand-adjacent) per v4.0 post-objective actions. The T3 objective tag and the campaign-name objective segment both update in the same staged set; a mismatch between them is the F7 condition.
5. Each ladder step is a T6 entry predicting rank hold at the reduced level. A WRONG-DIRECTION score (rank slips past the v4.0 tolerance) reverts one step and holds per #28; the restored value is the recorded floor candidate.
6. At the discovered floor, record the floor in T2 K8 with its date; the floor re-tests on the v4.0 quarterly cycle or after a logged competitive shock.
7. Evaluate P6 demotion at the floor: a floor-holding term that has also lost its oversight flag demotes; a floor-holding term retaining the flag stays Class 1 at

DEFEND AT FLOOR.

#### **P5. Promotion: tail to single-keyword campaign**

1. Trigger: the term meets the oversight criteria per v4.0 (volume, spend share, or push designation).
2. Create the dedicated campaign per P1 in full, including walls and the T6 prediction.
3. Pause the term in the consolidated ad group the same session. Pause, never delete: history stays readable for the promotion baseline.
4. A paused exact term cannot serve, so no negative is structurally required in the consolidated campaign; add one anyway when that campaign also hosts phrase or broad ad groups.
5. Move the term's budget share: the consolidated campaign budget reduces by the term's trailing daily spend; the new campaign carries it as its starting budget floor, with the push sizing from T2 K7 layered on top where a push verdict drove the promotion.
6. Registry counts update; the T6 entry predicts the dedicated campaign's efficiency against its consolidated baseline at a named review date.

#### **P6. Demotion: single-keyword campaign to tail**

1. Trigger: taper complete, floor discovered, and the v4.0 stability requirement met at the floor; or oversight flag lost.
2. Add the term to the family consolidated campaign at the discovered floor bid. Set the dedicated campaign PAUSED-PENDING with the reason and a named re-entry condition (the term re-promotes on a recovery verdict or a new funded push).
3. Registry updates; the T6 entry predicts efficiency hold at the consolidated level with a named review date.

#### **P7. Consolidate duplicates**

1. Trigger: CONSOLIDATE DUPLICATES verdict, or a registry read showing the same term live in 2+ exact instances with no declared distinct role per Section 1.2.
2. Survivor selection, in precedence order: (a) the instance with the declared role; (b) absent declared roles, the instance winning on the S-R14 evidence read (higher CVR at lower CPC over the validated window); (c) on a split read, the instance with the longer clean history whose settings match the term's current objective. Survivor selection is human-mandatory per the authority matrix.
3. Pause the loser; move its budget to the survivor; carry every negation list the loser held that the survivor lacks.
4. Where the loser held placement evidence the survivor lacks, hand the evidence to #28 with the consolidation note so the survivor's modifiers can be sized from it rather than rediscovered.
5. Registry decrements; the T6 entry predicts the survivor's combined efficiency and carries a root-cause line naming how the duplicate arose. The root-cause line feeds F4, and a recurring source escalates.

#### **P8. Pause and archive**

1. PAUSED-PENDING always carries a reason and a re-entry condition in T2 and T3; a pause without both is incomplete and returns to the pass.
2. Paused rows appear on the weekly pass as a re-entry check only: the pass tests the stated criterion and either re-enters or holds; it never re-litigates the pause.
3. Archive only campaigns paused beyond the governance period with no re-entry condition met. Archiving is irreversible and sits in the human-mandatory tier; the archive entry in T6 closes the campaign's history with its final registry state.

#### **P9. Event-window overlay**

1. Arm on G12: the confirmed deal window from the #32 event plan enters T2 with its dates; every exact row on the product carries the event flag through the window plus the post-event guard.
2. Inside the window, structure changes (creations, consolidations, promotions, demotions, archives) freeze unless the event plan names them. Budget assurance under G3 and the event plan's own staged actions remain live.
3. Event-week rates are excluded from trend verdicts through the guard period per the v4.0 event rules; the weekly pass reads the affected rows for gates only.
4. Post-window: ladders and floors resume from their pre-event values unless the event evidence justifies new ones per the #32 reconciliation; the resumption is a staged, logged set, not a memory exercise.

#### **P10. Variation re-point execution**

1. Trigger: RE-POINT VARIATION verdict, or G6 RED on the targeted variation with D2 naming the ranked backup.
2. Stage the advertised-SKU edit to the D2-named variation and deploy same day; a RED-driven re-point does not wait for Tuesday.
3. Log the re-point in T6 as a product event: CVR baselines reset at re-point, the trend clock restarts, and the row is read for gates only until the v4.0 sufficiency window refills.
4. On restock, re-point back per the T7 recovery play, logged the same way; the pre-OOS floor and ladder state restore from the T2 K8 record.

#### **P11. Bid and budget change mechanics**

1. Every bid or budget change exists first as a staged bulk row per #38 with prior value, new value, and the reason string carrying verdict and scenario ID. No console edits outside the staged set; a console edit found by the verification pass is an F10 event with a named root cause.
2. Step sizes, floors, and per-change limits are read from the L2 lever rules in v4.0 at execution time; this SOP never restates them. A staged step exceeding an L2 limit fails staging QA and returns to the pass.
3. Budget precedes bid whenever G3 is failing; bid reads resume the next untruncated day. In tapers, budget follows the bid down per P4 step 3.
4. Ladder executions (taper, bid-down, defense restore) deploy one step per staged set with the next step's date in the reason string, so the T6 chain reads

as a dated ladder and V5 can score each step independently.

## P12. Intraday funded-push pacing

1. Twice daily on every FUNDED row: read in-budget % and the cumulative spend curve against the day-of-week expectation from the T2 K7 sizing block. A push spending materially off-curve routes to the budget lever or to the PPC Lead per the alarm's severity, same day.
2. The loss check runs with the pacing check: cumulative weekly spend minus (orders times contribution) against the verdict-carried loss ceiling. The ceiling comparison and its scenario call are v4.0's; this procedure only surfaces the numbers on the intraday cadence.
3. Hourly truncation alarm on push campaigns during deployment days: an in-budget breach executes the budget lever same day and voids the week's bid read for the row (F1).
4. Every intraday intervention writes a T6 line; pacing interventions do not change bids, ever. Bid decisions live in the weekly pass and in verdict-carried ladders only.

## 5. Decision Points: The Full Verdict-to-Execution Mapping

All verdict issuance, thresholds, and scenario logic live in v4.0. This table maps the complete 25-verdict closed vocabulary to what this SOP does when each verdict lands on an exact-relevant row. Where execution belongs to an adjacent SOP, the boundary is stated so no verdict falls into a seam.

| Verdict (closed vocabulary)              | Exact-campaign execution                                                                                                                                                                     |
|------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| QUARANTINE: DATA REFRESH                 | No changes deploy on the row; the refresh task carries the row's staged set forward to the next clean cycle.                                                                                 |
| UNLOCK TRAFFIC                           | Bid steps up per the L2 unlock mechanics on the named campaign; no rate judgments until sufficiency per G2.                                                                                  |
| FIX BUDGET (TRUNCATED)                   | Budget lever only (G3, P11 step 3); bid reads resume the next untruncated day.                                                                                                               |
| CONTINUE TEST TO 50 CLICKS AT CAPPED BID | No changes except budget assurance (G3 check); the test runs to its click quota at the capped bid.                                                                                           |
| FUND TEST (UNFUNDED PRIMARY)             | P1 or P2 creation at the capped test bid the verdict names; test status and stop-loss date into T2 K7.                                                                                       |
| RANK PUSH: FUND SIZED PUSH               | P1 (or bid and budget lift on the existing dedicated campaign) on the funding release date; bidding strategy per v4.0 4.4; sizing fields from T2 K7 govern budget; P12 pacing arms same day. |
| RECOVERY PUSH                            | As FUND SIZED PUSH, sized toward the pre-OOS baseline per S-R12; the T2 pre-OOS floor and ladder state inform the starting bid.                                                              |
| TRAFFIC DEFICIT: FEED TO REQUIRED CLICKS | Bid or budget lift per the verdict's named lever on the dedicated campaign; never both levers in one cycle on one row (P3 step 5).                                                           |
| FIX CONVERSION FIRST; DEFER PUSH         | Cap the campaign at maintenance (bid and budget per the verdict); the fix routes to the D6-named owner outside this SOP; the row re-enters on the stated criterion.                          |
| PLACEMENT FIX FIRST                      | Bids hold; #28 executes the placement program; this SOP deploys only the campaign-level rows #28 stages back.                                                                                |
| RE-POINT VARIATION                       | P10 in full, same day.                                                                                                                                                                       |
| TAPER: RANK ACHIEVED, STEP BIDS DOWN     | P4 in full.                                                                                                                                                                                  |
| HOLD; DEFEND LIGHTLY AT RANK             | No change this cycle; the WoW block is read next cycle; drift from the held position is the trigger v4.0 watches, not this SOP.                                                              |
| DEFEND AT FLOOR                          | No bid change; if drift from the recorded discovered floor is detected, the bid restores to the floor value in one staged step.                                                              |
| BID DOWN TO PROFITABLE CPC; CAP SYNTAX   | Bid edit to the T2 K6 Max Profitable CPC value for the row, single step. The syntax-cap half executes at T1 per #31; exact campaigns receive the resulting deltas.                           |
| INCREMENTALITY LADDER                    | The dated spend step-downs execute on the exact campaign per the M8 program; measurement design and the continue/restore call belong to #35 and v4.0.                                        |
| ADD EXACT + RESTRUCTURE                  | P1/P2 for the uncovered term plus steering walls per #29; the restructure note names which source campaign was carrying the term.                                                            |
| CONSOLIDATE DUPLICATES                   | P7 in full.                                                                                                                                                                                  |
| GRADUATE FROM DISCOVERY                  | Receipt from #30: P1/P2 same day plus #29 walls same session; the graduation record's discovery CPC and order evidence seed the starting bid the verdict carries.                            |
| NEGATE (PRE-LOAD / REACTIVE / STEERING)  | Owned by #29. This SOP's role is structural: walls at every P1/P2/P5/P7 event, built same session, recorded in T3.                                                                           |

|                                           |                                                                                                                                                                            |
|-------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ENTER SBV ARBITRAGE</b>                | This SOP executes only the SP-exact side: one ladder step down on the named campaign, dated with the SBV go-live. The SBV build belongs to #17-19.                         |
| <b>OPEN / ROTATE / EXIT CONQUEST</b>      | Owned by #16; no exact-campaign execution unless the verdict names a shared-term bid step, which deploys per P11.                                                          |
| <b>STOP-LOSS: CONCEDE OR DEFER</b>        | The push campaign steps to maintenance or PAUSED-PENDING per the verdict text; freed budget returns to the envelope and re-allocates per M5 at #31, never inside this SOP. |
| <b>PAUSED-PENDING (REASON + RE-ENTRY)</b> | P8 steps 1-2.                                                                                                                                                              |
| <b>LEAVE TO HARVEST</b>                   | No exact instance is stood up; any live exact instance on the term is evaluated for P6/P8; the term runs on discovery economics under #30's rules.                         |

## 6. Worked Examples

Illustrative values, internally consistent; live values come from T0 and T2.

### WE-1 · Ranking push: creation, cycle read, and M3-compliant taper

**Setup.** Term "bamboo sheets king", oversight class, objective Ranking, organic rank 18 vs target 5. Product economics from T0: AOV \$80.00, contribution \$28.00/order, BE ACOS =  $28.00 / 80.00 = 35.0\%$ , Target ACOS = 17.5%, Max Acceptable = 26.3%, Expected CPC \$2.50. Term CVR (validated, 212 clicks trailing) = 5.2%; Max Profitable CPC =  $28.00 \times 0.052 = \$1.46$ . Verdict in T2: RANK PUSH: FUND SIZED PUSH, funded by M5 at +\$180/wk on top of the existing \$142/wk, loss ceiling \$40/wk net of rank-carried sales, review in 14 days, prediction: rank 18 to 11 or better within 2 weeks at push pace.

**P1 execution.** (1) Oversight flag Y. (2) Registry: # Exact = 0, creation legal. (3) Gates: GREEN on B4-KING-WHITE (47 days cover), no event, margin fresh. (4) Name: DBS4-SP-bamboo sheets king-HSV-Exact-Rank-Fix-B4-KING-WHITE. (5) Daily budget = \$322/wk / 7 = \$46.00/day; bidding per 4.4 for Ranking. (6) Advertised SKU = B4-KING-WHITE (D2 preferred). (7) Bid \$2.60, carried by the T2 K7 sizing, not invented here. (8) Modifiers 0/0/0: no #28 evidence yet. (9) Walls: negative exact in the B4 broad family campaign, both B4 autos, and the sibling 6-piece broad per declared root ownership; wall list into T3. (10) K8 0 to 1; T3 row created. (11) T6: "Created Rank push campaign; predict rank 18 to 11 within 14d at \$46/day; loss ceiling \$40/wk; review 14d; score V5." (12) Same-day deploy on the funding release; T+1 verification clean.

**Cycle read, day 7 (P3).** In-budget 100% (G3 clean), inventory GREEN, spend \$301, clicks 118, CPC \$2.55, orders 6, CVR 5.1%, ACOS =  $301 / (6 \times 80.00) = 62.7\%$ , rank 18 to 13, velocity 0.71 positions/day, projecting rank 8 by day 14. ACOS reads 2.39x above Max Acceptable and the read is ACCEPTABLE INSIDE THE PUSH: the governing number is the loss line, gross weekly loss =  $301 - 168 = \$133$  before rank-carried sales, and the ceiling comparison with its scenario call belongs to v4.0, which returns CONTINUE (trajectory ahead of pace, loss inside the sized plan). No bid change; T6 note appended.

**Days 14-21 and taper (P4).** Day 14: rank 10, hold begins. Day 21: rank 9 held; stability requirement met; TAPER issues. Step 1: bid \$2.60 to \$2.34 at the M3 step size, dated, predicting rank hold at 9-11; budget normalizes behind it. Step 2 the following week to the placement-CPC exit reference from #28: blended placement CPC \$2.31 minus the exit offset = \$2.24. Objective retags Ranking to Conversions in T3 and in the campaign name segment in the same staged set. Each step is a scored T6 row; a slip past tolerance reverts one step and records the floor.

### WE-2 · Graduation receipt into the tail, then promotion at the oversight boundary

**Setup.** #30 issues GRADUATE FROM DISCOVERY on "cooling bamboo sheets queen" (4 orders from the B4 broad family campaign). No oversight flag: Class 2, so P2 fires same day. The family consolidated campaign for the bamboo-sheets root exists with 14 terms in ad group 1.

**P2 execution.** Term added as the 15th term in ad group 1 at the verdict-carried bid of \$1.20 (seeded from the \$1.12 discovery CPC in the graduation record). Walls same session: negative exact in the source broad and both autos. T3 row, T6 entry: "Graduated at 4 orders; predict CVR at or above the discovery read within 30d at CPC at or below \$1.30; review 30d."

**30-day read and promotion (P5).** Trailing 30d: 96 clicks, 7 orders, CVR 7.3%, CPC \$1.18, spend \$113, sales \$560, ACOS 20.2%, inside Max Acceptable at the Conversions objective. The term crosses into the product's top spend decile and gains the oversight flag, so P5 fires: dedicated campaign created per P1 (walls re-verified, prediction logged), the term pauses in the consolidated ad group the same session, and the trailing \$3.77/day spend share moves from the consolidated budget to the new campaign as its starting floor. T6 prediction: dedicated efficiency at or better than the 20.2% consolidated baseline within 2 cycles.

### WE-3 · Duplicate consolidation with the survivor rule

**Setup.** Registry read on "satin sheets queen": 2 live exact instances, no declared roles, so P7 fires. Instance A: 14 months clean history, trailing CVR 6.1% at CPC \$1.62, settings match the term's Conversions objective, weekly spend \$98 on sales \$420 (ACOS 23.3%). Instance B: 5 months, CVR 4.8% at CPC \$2.19, weekly spend \$63 on sales \$168 (ACOS 37.5%). Combined ACOS 27.4%.

**P7 execution.** Survivor = A on the S-R14 read (higher CVR at lower CPC) with the longer clean history confirming; the selection is human-confirmed per the authority matrix. B pauses as PAUSED-PENDING (consolidation, re-entry: none; archive candidate at the governance period). B's \$9.00/day budget moves to A; the 3 negatives B held that A lacked carry over; B's TOS placement rows hand to #28 with the note. Registry 2 to 1. T6: "Consolidated to A; predict blended ACOS 27.4% to 24.0% or better within 2 cycles at flat order volume. Root cause: B created during the March launch push without a registry read (P1 step 2 skipped); source flagged for F4 tracking."

## 7. Failure Modes and Escalation

| Failure | Detection signal | Response |
|---------|------------------|----------|
|---------|------------------|----------|

|                                                          |                                                                                               |                                                                                                                                                        |
|----------------------------------------------------------|-----------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>F1. Push starved by truncation</b>                    | In-budget % under 100 on a row with a push objective (T2 K2); P12 hourly alarm on deploy days | G3: budget lever same day; the week's bid read is voided for the row; truncation cause into T6.                                                        |
| <b>F2. Graduate double-buying (wall missed)</b>          | Same search term converting in the exact AND a source campaign in the search-term data        | Wall built immediately per #29; the #29 wall audit adds the source; root cause names which P1/P2 session skipped its wall step.                        |
| <b>F3. Wrong advertised variation vs D2</b>              | D2 map mismatch column; CVR anomaly vs family                                                 | RE-POINT VARIATION execution per P10; T6 notes the CVR baseline reset.                                                                                 |
| <b>F4. Duplicate re-creation after consolidation</b>     | Registry # Exact above 1 with no declared role                                                | P7 re-run plus named root cause; a recurring source escalates to the PPC Lead with the T6 history.                                                     |
| <b>F5. Taper never triggered post-rank</b>               | Rank at or better than target + push-level spend + weeks-at-verdict accruing                  | P4 immediately; the weekly pass carries a standing audit line for this pattern, the account's known failure class.                                     |
| <b>F6. Naming non-compliance breaking audit filters</b>  | T3 naming-compliant flag                                                                      | Rename via bulk; no other change rides the rename deployment.                                                                                          |
| <b>F7. Objective retag missed after taper</b>            | T3 objective tag vs campaign-name objective segment mismatch                                  | Retag both surfaces in one staged set per P4 step 4; V5 marks the originating taper step as a process miss.                                            |
| <b>F8. Structure change inside an armed event window</b> | T6 structure entry dated inside a G12 window with no event-plan reference                     | Revert unless the event plan names it; the deviation escalates per #32; trend exclusions extend from the revert date.                                  |
| <b>F9. Wall built at the wrong level</b>                 | Source-campaign impressions collapse on adjacent tail terms after a wall build                | Replace the over-broad negative with the negative-exact wall per #29; restore the tail terms' serving; root cause into the #29 wall audit.             |
| <b>F10. Landed values differ from staged values</b>      | #38 T+1 verification mismatch report; console edits outside the staged set                    | Redeploy the delta same day; the week's reads on affected rows are void; a console-edit root cause names the actor and routes to change control (#37). |

**Escalation.** The same failure mode twice in consecutive cycles on the same scope escalates to the PPC Lead with the T6 history attached. Anything touching the human-mandatory tier (campaign creation on funded pushes, P7 survivor selection, P8 archives, cross-family budget moves, any deployment confirm) is confirmed per the authority matrix before deployment, without exception.

## 8. Outputs and Artifacts

| Event                                       | Artifact set produced (gates clear with artifacts, not assertions)                                                                                                                                                                                                                                                          |
|---------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Weekly pass (P3)</b>                     | Updated T2 rows (verdict execution state), T3 registry current, staged bulk change set per #38 with verdict + scenario ID reason strings, the deployed-and-verified bulk set with its T+1 report, T6 decision-log entries each carrying a prediction and review date, and the V5 scores recorded for last cycle's due rows. |
| <b>Structure events (P1/P2/P5/P6/P7/P8)</b> | T3 row created or updated with role, owner, and wall list; T2 K8 count change; T5 product-log entry for material structure events; the T6 prediction row.                                                                                                                                                                   |
| <b>Ladders (P4, P11 step 4)</b>             | Dated T6 chain, one row per step, each independently scoreable; the recorded floor with its date in T2 K8 at completion.                                                                                                                                                                                                    |
| <b>Intraday (P12)</b>                       | Pacing and loss-line T6 entries; alarm evidence lines for F1; zero bid changes.                                                                                                                                                                                                                                             |
| <b>Event windows (P9)</b>                   | The armed-window record in T2, deviation log (empty is the passing state), and the post-window resumption staged set.                                                                                                                                                                                                       |

## 9. Skill-Conversion Block (Element 9 handoff)

| Block                                 | Specification                                                                                                                                                                                                                                                                                                                                                   |
|---------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Input bindings (catalog IDs)</b>   | A2 deployment state, A3 pacing and in-budget, A5 threshold flags, A6 objective + Expected CPC, A7 eligibility, B1 indexing and placement, B5 coverage counts, B8 economics chain, B9 WoW deltas, D2 variation map, D7 decision log. An absent feed suppresses its dependent execution class per the manifest; the skill never improvises around a missing feed. |
| <b>Deterministic logic references</b> | v4.0 scenario matrices and verdict issuance; this SOP's Section 5 mapping; #29 wall rules; #28 ladder steps; #38 staging format. The skill executes mappings; it never computes its own thresholds, and it version-pins v4.0 per the V6 sync rule.                                                                                                              |
| <b>Human checkpoints (10-80-10)</b>   | AI-executable with audit: staging bulk rows for issued verdicts, wall additions, registry updates, T6 drafting, intraday pacing reads, verification-report reconciliation. Human-mandatory: campaign creation on funded pushes, P7 survivor selection, P8 archives, cross-family budget movement, every deployment confirm.                                     |

|                            |                                                                                                                                                                                                                                                                              |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Intraday cadence</b>    | Funded-push pacing twice daily (P12 steps 1-2); truncation alarm hourly on push campaigns during deployment days; T+1 deployment verification; graduation-arrival execution same day; G4 eligibility and G6 RED alarms same day.                                             |
| <b>Alarm specification</b> | F1-F10 each carry a detection signal from Section 7, an evidence-line format (row, signal value, gate or rule reference), and a routing tier: F1/F3/F10 same day to the operator queue; F2/F6/F7/F9 into the weekly pass worklist; F4/F5/F8 to the PPC Lead with T6 history. |
| <b>Skill outputs</b>       | Drafted bulk change sets plus drafted T6 entries queued for human confirmation; verification reconciliation reports; F1-F10 alarms with evidence lines; the V5 scoring draft for rows due this cycle.                                                                        |

## 10. Version Governance

Owner: PPC Lead. Review: monthly, and immediately on any v4.0 version increment, at which point the Section 5 mapping re-validates against the new verdict set before any pass runs on it. Registered in the Supersession Map at publication. v2.0 change note: supersedes v1.0 in full; procedures expanded 8 to 12 (adds P9 event overlay, P10 re-point, P11 change mechanics, P12 intraday pacing); verdict mapping expanded 14 to the full 25-verdict closed vocabulary with boundary statements; worked examples expanded 1 to 3; failure modes expanded 6 to 10; WE-1 taper ladder corrected to the M3 step size (\$2.60 to \$2.34, then to the \$2.24 exit reference; v1.0 showed a first step past the M3 size); survivor-selection precedence made explicit in P7; V5 scoring moved to the front of the weekly pass (P3 step 2).

**v2.1 change note.** v2.1 is an amendment, not a rebuild: Sections 1 to 10 carry forward from v2.0 without edit, and Sections 11 and 12 are added as the Build Kit v1.0 Elements 11 and 12 that v2.0 lacked. Three review triggers are added, specific to the added material and to nothing else in this document. First, Section 11 re-issues within one week of any re-issue of the PPC Authority Matrix, because every ramp competence in it is a matrix row and a moved letter moves a competence. Second, Section 12 re-issues on any Cross-Reference Ledger version that rewrites the row for component 12 or the row of any counterparty named in 12.2 or 12.3, because an interface contract written against a superseded row is a contract with nobody. Third, Section 11.5 re-issues on any v4.0 increment that changes a rule cited in a live-defense answer, since a defense question that tests retired reasoning trains the wrong operator. The v2.0 triggers stand unchanged for Sections 1 to 10.

## 11. Operator Ramp NEW AT v2.1

**VERDICT:** an incoming operator holds this SOP when every Authority Matrix v2.0 row that names an exact-campaign decision can be executed at that operator's letter without the checkpoint holder changing a staged value, and when the reasoning behind each governing threshold can be defended without reciting the threshold's number. The ramp is 10 matrix rows read across 3 checkpoints: week 1 observation and artifact familiarity, week 2 supervised execution with the checkpoint holder reviewing before deployment, week 4 unsupervised execution with the checkpoint holder auditing after deployment. Week 4 does not move the human-confirmation line. That line is fixed by v4.0 Section 12 "Layer 7: Precedence and Conflict Resolution (P1-P10)" rule P5, which places every 500+ SV keyword action, every gate failure, every structural change, every bid move above 25%, every budget move above \$50/day, and every LOW-confidence verdict in the human-confirmed tier permanently, for every operator at every tenure. An operator who stops routing those items has failed week 4, not completed it.

### 11.1 The Authority Matrix rows this SOP executes

Every competence below is one row of the PPC Authority Matrix v2.0 Section 1 "The Matrix" turned into something a person demonstrates. Ten rows name decisions that this SOP executes or receives. D decides, E executes, R reviews, I is informed, per the matrix legend. The incoming operator column is the scope this ramp fills.

| Authority Matrix v2.0 row               | D holder                                     | Incoming operator | What SOP-12 does under this row                                                                                                                                                    |
|-----------------------------------------|----------------------------------------------|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Weekly verdicts (established US)</b> | PPC Lead                                     | E, assigned scope | P3 in full: gates before metrics, K9 verdict to the Section 5 execution, one lever per row per cycle, staged per #38 with the scenario ID.                                         |
| <b>Structure creation (all SOPs)</b>    | PPC Lead, or per SOP scope                   | E                 | P1 and P2 creation, P5 promotion, P6 demotion, P7 consolidation, P8 pause and archive. The BM owner is I on this row, so structure events are reported, not negotiated.            |
| <b>Push funding (the M5 queue)</b>      | CEO above envelope; PPC Lead within envelope | E                 | Standup on the dated release only. This SOP never originates a funding decision, and an unfunded push has no legitimate execution path here.                                       |
| <b>Bulk deployments (#38)</b>           | No D on this row; PPC Lead reviews           | E                 | P11 staging and the Tuesday deploy after the BM huddle; T+1 reconciliation and the F10 delta redeploy. Matrix standing rule 2 governs: E without D executes staged decisions only. |
| <b>Sibling declarations (S-series)</b>  | PPC Lead                                     | E                 | The G11 check before any scale action on a shared term, and execution of the declared owner's posture on the exact campaign. The declaration itself is not this SOP's.             |
| <b>Event plans (#32)</b>                | PPC Lead with the deals owner                | E                 | P9 arming, the structure freeze inside the window, and the staged post-window resumption set.                                                                                      |

|                                     |                                                              |         |                                                                                                                                                                                                              |
|-------------------------------------|--------------------------------------------------------------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Incrementality tests</b>         | Incoming operator, per the Transition Brief v1.2 scope stack | D and E | The dated spend step-downs on the exact campaign under the INCREMENTALITY LADDER verdict. This is the one row where the incoming operator holds D, and it is therefore the row week 4 audits hardest.        |
| <b>Code-red declaration + close</b> | PPC Lead                                                     | E       | Execution of the exact-campaign half of a code-red program. Declaration and close are read-only to this SOP.                                                                                                 |
| <b>Automation rules (#37)</b>       | PPC Lead                                                     | E and R | The F10 console-edit root cause routes to change control at #37. The operator reviews the rule register against what landed; the rule change is not this SOP's.                                              |
| <b>v4.0 threshold changes</b>       | CEO                                                          | I       | Nothing. This row is in the ramp because it is the authority fact behind Section 1.3: a number the operator wants and v4.0 does not carry is an amendment request, never a value typed into a reason string. |

**Scope, vacancy, and the two rows this ramp does not confer.** The incoming operator's product scope comes from the Transition Brief v1.2 stack per Authority Matrix standing rule 4, not from this document. Two matrix rows carry a different D and stay outside this ramp: "Launch-stage verdicts + batches" and "Canada weekly block", both held D and E by the launch/CA operator. An operator ramped on this SOP executes steady-state US scope only until the brief assigns otherwise. If the checkpoint holder role is unfilled at any point in the ramp, standing rule 5 applies: the unfilled role's D reverts to the PPC Lead and its E to the PPC Manager until filled, and the ramp continues against those holders rather than pausing.

## 11.2 Week 1: observation and artifact familiarity

Nothing deploys under the incoming operator's name in week 1. The week produces nine written artifacts, each read by the checkpoint holder named on the matrix row. The test of week 1 is not whether the operator agrees with the account; it is whether the operator can find every number this SOP consumes without being told where it lives.

| ID          | Competence demonstrated                                          | Demonstration                                                                                                                                                                                                                              | Evidence artifact and reviewer                                                                                |
|-------------|------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------|
| <b>W1.1</b> | Read the packet before the account (matrix row: weekly verdicts) | Open T7 Manifest and list every field group reading MISSING or PARTIAL, with the verdict class each one blocks, taken from the T7 column "Verdict Classes Blocked While Missing".                                                          | Written manifest read; PPC Lead. A read that names fewer blocked classes than the manifest lists is returned. |
| <b>W1.2</b> | The cascade order (P3 step 1)                                    | Walk T0, then T1, then T2 on one product and state in one line each what T0 constrains and what T1 caps before any keyword is read.                                                                                                        | Cascade note; PPC Lead.                                                                                       |
| <b>W1.3</b> | The two structure classes (Section 1.1)                          | Count Class 1 and Class 2 campaigns for one product from T3 "Campaign Name" and "Objective Tag", and reconcile the count to T2 K8 "# Exact".                                                                                               | Reconciliation with the variance explained if any; PPC Manager.                                               |
| <b>W1.4</b> | Sizing is received, not authored (matrix row: push funding)      | Read one live push row's T2 K7 block (Objective, DST, Required clicks/day, Required budget \$/wk, Loss ceiling \$/wk, ETA checkpoint date, Review date) and mark which fields arrived with the verdict and which this SOP would never set. | Annotated K7 block; PPC Lead.                                                                                 |
| <b>W1.5</b> | Scoring precedes deciding (P3 step 2)                            | List the T6 Decision Log rows whose "Review Date" lands in the current cycle and state what each one predicted. Score nothing.                                                                                                             | Due-row list; PPC Lead.                                                                                       |
| <b>W1.6</b> | The deployment path (matrix row: bulk deployments)               | Observe one Tuesday deployment end to end without touching a console, then read the #38 T+1 verification report against the staged set.                                                                                                    | Reconciliation note naming any mismatch; PPC Manager.                                                         |
| <b>W1.7</b> | Authority literacy                                               | For each of the ten rows in 11.1, state who holds D in this operator's scope and what standing rule 5 does if that holder is absent.                                                                                                       | Row-by-row statement; PPC Lead.                                                                               |
| <b>W1.8</b> | Walls are structure, not opinion (P1 step 9)                     | Read the wall list on one T3 row and name every source campaign it fences and one it does not. Propose no change.                                                                                                                          | Wall read; PPC Lead, shared with the #29 owner.                                                               |
| <b>W1.9</b> | The intraday cadence (P12)                                       | Sit both pacing reads on one day of a live funded push and state, from the T2 K7 curve, whether the day was on plan.                                                                                                                       | Two dated pacing notes; PPC Manager.                                                                          |

**Week 1 closes** when the checkpoint holder has recorded all nine competences as demonstrated. A competence not demonstrated repeats in week 2 alongside the week 2 work; it does not block the ramp, and it does not silently disappear either.

### 11.3 Week 2: supervised execution

The operator stages; the checkpoint holder reviews every staged row before it reaches #38; nothing the operator stages deploys unreviewed. The supervision is on the artifact, not on the person: the reviewer reads the staged bulk row and its reason string, and the reason string either carries a verdict and a scenario ID or it fails staging.

| ID   | Competence demonstrated                                                                       | Supervised task                                                                                                                                                                                   | Review test the checkpoint holder applies                                                                                                                                                                                       |
|------|-----------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| W2.1 | Same-day graduation execution (matrix row: structure creation)                                | Take one GRADUATE FROM DISCOVERY receipt from #30 and stage the standup: class per the oversight criteria, family, the verdict-carried bid, walls in every serving source, T3 row, T6 prediction. | Bid equals the value the receipt carried, to the cent. Wall count equals the serving-source count on the receipt. Any invented bid returns the standup as incomplete per P1 step 7.                                             |
| W2.2 | Verdict execution at scale (matrix row: weekly verdicts)                                      | Execute the Section 5 mapping across every row in the assigned scope carrying a K9 verdict this cycle, gates read before metrics on each.                                                         | One lever per row per cycle unless the verdict named two. No two rows with opposite four-period trends carrying the same execution.                                                                                             |
| W2.3 | Ladder steps are received (P4, P11 step 4)                                                    | Stage one taper step from the step #28 derived, with the next step's date in the reason string.                                                                                                   | The step size matches what #28 sent. A step the operator sized is rejected on sight: step sizes and limits are v4.0 Section 9 "Layer 4: The Lever Library (L1-L10). Order, Limits, Mechanics" rule L2, read at execution time.  |
| W2.4 | Gate discipline (P3 step 3)                                                                   | On a row failing G3, execute the budget lever and defer the metric verdict to the next clean cycle.                                                                                               | No bid change rides the truncated day. The deferral is written on the row, not remembered.                                                                                                                                      |
| W2.5 | Registry hygiene (P7)                                                                         | Run a registry read across the scope and produce a survivor recommendation for any undeclared duplicate, in the P7 step 2 precedence order.                                                       | The recommendation states which precedence limb decided it. The selection itself stays human-mandatory with the checkpoint holder; a survivor chosen by the operator alone fails the task even when it is the correct survivor. |
| W2.6 | Prediction discipline (v4.0 Section 14 "Layer 9: Verification and Learning (V1-V8)", rule V1) | Write the T6 prediction for every change staged this week: metric, direction, magnitude, horizon, review date.                                                                                    | Five fields present on every row. A change with no prediction does not deploy, per P1 step 11 and P3 step 9.                                                                                                                    |
| W2.7 | Verification reconciliation (F10)                                                             | Reconcile the T+1 report and stage the delta redeploy for any mismatch, same day.                                                                                                                 | The delta is staged, not consoled. A console edit is the F10 condition with a named actor.                                                                                                                                      |
| W2.8 | The refusal (matrix row: v4.0 threshold changes)                                              | Identify one request in the week that would place a number with no v4.0 basis into this SOP or into a reason string, and route it as an amendment instead of executing it.                        | The routed item names what it needs and why v4.0 does not answer it. This competence is demonstrated by declining, and an operator who never declines anything in week 2 has not demonstrated it.                               |

**Week 2 closes** when the checkpoint holder's review changed no staged value on the final cycle of the week, and every staged row in that cycle carried a verdict and a scenario ID.

### 11.4 Week 4: unsupervised execution under audit

Week 3 repeats week 2 on the full assigned scope. From week 4 the operator deploys within scope without pre-review, with two permanent exceptions and one audit.

- The P5 tier never becomes unsupervised.** v4.0 Section 12 "Layer 7: Precedence and Conflict Resolution (P1-P10)" rule P5 states that every 500+ SV keyword action, every gate failure, every structural change, every bid move above 25%, every budget move above \$50/day, and every LOW-confidence verdict is human-confirmed. The Authority Matrix places that confirmation with the row's D holder. Week 4 changes who drafts and who deploys the routine tail; it does not move one item out of the P5 tier.
- The human-mandatory list in Section 9 stands.** Campaign creation on funded pushes, P7 survivor selection, P8 archives, cross-family budget movement, and every deployment confirm remain confirmed before deployment, per the Section 7 escalation paragraph.
- The audit is post-deployment and evidence-based.** The checkpoint holder reads the cycle's T6 entries against the deployed bulk set and the #38 T+1 report, and checks five things: every deployed row carries a verdict and a scenario ID; every deployed row carries a prediction with a review date; no P5-tier item deployed unconfirmed; every gate failure in the scope executed its gate lever rather than a metric verdict; and last cycle's due rows were scored before this cycle's verdicts were read.

| ID   | Competence demonstrated                                                                                | Audit evidence the checkpoint holder reads                                                                                   |
|------|--------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------|
| W4.1 | Ownership of the weekly pass for the assigned scope, T0 through T2, gates through staging through T+1. | The cycle's staged set, its T+1 report, and the T6 entries, read as one chain. A break anywhere in the chain is the finding. |

|             |                                                                                                         |                                                                                                                                                                  |
|-------------|---------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>W4.2</b> | Routing every P5-tier item to its confirmation holder before deployment.                                | The confirmation record against the deployed set. A P5-tier item deployed unconfirmed stops the ramp the same day and returns the scope to supervised execution. |
| <b>W4.3</b> | Scoring last cycle's due rows before reading this cycle (P3 step 2).                                    | V5 scores present on every due row, using the four permitted values HIT, PARTIAL, MISS, WRONG-DIRECTION.                                                         |
| <b>W4.4</b> | Producing the F1 to F10 alarm set with evidence lines and routing each per the Section 9 routing tiers. | Alarm list with row, signal value, and gate or rule reference on each line; routing matches the tier.                                                            |
| <b>W4.5</b> | Holding the boundary: naming the owning component for every decision this SOP does not make.            | Every item the operator routed out this cycle names its component by number, per Section 1.3, with no restatement of that component's procedure.                 |
| <b>W4.6</b> | Executing the one row where this operator holds D: the dated incrementality step-downs.                 | The dated step chain in T6 against the #35 measurement design; the continue or restore call is not the operator's and must appear as received, not decided.      |

**Audit findings return as competence gaps, not as reversals.** A staged value the checkpoint holder would have chosen differently is a conversation; a deployed value that broke the chain in W4.1 or the routing in W4.2 is a stop. The distinction matters because an operator who is corrected on judgment learns to route everything upward, which reproduces the bottleneck the ramp exists to clear.

### 11.5 Live-defense questions

Fourteen questions, asked cold by the checkpoint holder at the end of week 4. They test why the rule is the rule. None of them asks for a threshold's value, and an answer that recites a number without its reasoning does not pass. The sources are named so the reviewer can check the answer rather than judge it.

| Q          | Question                                                                                                                                                 | What a passing answer contains, and its source                                                                                                                                                                                                                                                                                                            |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Q1</b>  | A funded push row reads an ACOS several times its Max Acceptable and the correct verdict is still CONTINUE. Why, and what single number would change it? | Percentage is not the binding constraint inside a sized push; the loss line is, and the loss ceiling is set before the push runs. The number that flips it is cumulative loss reaching the ceiling, which issues STOP-LOSS: CONCEDE OR DEFER. Source: v4.0 Section 10 "Layer 5: Sizing Mathematics (M1-M10). Every Action Carries Numbers", rule M2.      |
| <b>Q2</b>  | Why does budget move before bid on a truncated campaign, rather than both together?                                                                      | A starved campaign's rates describe its worst hours, not its potential, so the bid read is not evidence yet. Lever precedence puts budget first whenever the truncation gate is failing. Source: v4.0 Section 5 "Layer 0: Gates (G1-G12). Nothing Proceeds Until These Pass", gate G3, with rule L1 in Section 9.                                         |
| <b>Q3</b>  | Two sibling products are pushing the same term. Why is that one decision rather than two?                                                                | Two active push objectives on one term is a portfolio question: a lead product is assigned and the sibling takes a support or stand-down posture; neither push scales until then. Portfolio calls bind product plans. Source: v4.0 Section 5, gate G11, and Section 12, rule P9.                                                                          |
| <b>Q4</b>  | The same term is live in two exact campaigns and both are profitable. Why is that still a defect?                                                        | Multiplicity is legal only with a declared distinct role from the four in Section 1.2; without one the term competes with itself, the registry cannot be read, and the prediction cannot be scored against one term's spend. Source: PPC Strategic Doctrine v1.0 Section 5.2, executed at P7.                                                             |
| <b>Q5</b>  | You believe the taper step is too slow for this term. What is the correct action?                                                                        | Execute the step as derived and file the disagreement as an amendment request with evidence. Step sizes are lever rules, and rule changes run through the versioned amendment protocol, not through a single execution. Source: v4.0 Section 9, rule L2, and Section 14, rule V3; Authority Matrix row "v4.0 threshold changes", where the operator is I. |
| <b>Q6</b>  | Rank touched target this morning. Why does the taper not start today?                                                                                    | The objective transition is evidenced by rank held, not rank touched, so the stability requirement runs before the ladder starts; a taper from an unstable position rebuys the push. Source: v4.0 Section 11 "Layer 6: Transitions, Stages, Modes (T1-T8) and Recovery Mode (R1-R6)", rule T1, then rule M3.                                              |
| <b>Q7</b>  | A rank-objective term is not indexed. Why is a higher bid not the answer?                                                                                | No bid level ranks an unindexed term; spend against it buys clicks that cannot build the organic position the objective is for. The listing task precedes any push funding. Source: v4.0 Section 5, gate G5.                                                                                                                                              |
| <b>Q8</b>  | A term has a handful of clicks and a striking conversion rate. Why is there no rate verdict?                                                             | Below the sufficiency thresholds a rate is not a reading; the window falls back and, if still thin, the row stays on a capped, dated test rather than receiving a rate judgment. Week-over-week swings on thin samples are noise by definition. Source: v4.0 Section 5, gate G2; the verdict string is CONTINUE TEST TO 50 CLICKS AT CAPPED BID.          |
| <b>Q9</b>  | Why does a graduation standup build walls in the same session rather than in the next negation pass?                                                     | Until the sources are fenced the account buys the same term twice, once with precision and once without, and the exact's economics are unreadable because its own source is competing with it. Source: PPC Strategic Doctrine v1.0 Section 3.1 on steering negation; failure mode F2.                                                                     |
| <b>Q10</b> | Why does the weekly pass score last cycle before it reads this cycle?                                                                                    | Unscored actions accumulate into a log nobody can learn from, and rule accuracy cannot be computed per rule without scores. Scoring first also stops the pass from re-deciding a row whose prediction was about to be answered. Source: v4.0 Section 14, rules V1 and V5.                                                                                 |
| <b>Q11</b> | Confidence on a verdict reads LOW. Why does that shrink the move rather than delay it?                                                                   | Uncertainty buys smaller steps, never bigger ones: step sizes and budget steps halve, the review horizon shortens, and pushes are barred, so the account keeps learning at lower cost instead of                                                                                                                                                          |

stopping. Source: v4.0 Section 10, rule M10.

|            |                                                                                                             |                                                                                                                                                                                                                                                                                                                                        |
|------------|-------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Q12</b> | The automation platform changed a bid between cycles and your audit disagrees. Which value stands?          | The audit value wins and automation resumes from it; the conflict is flagged on the decision-log row rather than resolved silently. Source: v4.0 Section 12, rule P3, with the conflict-flag column in T6.                                                                                                                             |
| <b>Q13</b> | A landed value differs from the staged value and the fix would take one console edit. Why stage it instead? | Every change exists first as a staged row with prior value, new value, and a reason string, or the record is not auditable and the next cycle cannot attribute the result; an unstaged edit is the F10 condition with a named actor and routes to change control. Source: this SOP P11 step 1; v4.0 Section 12, rule P10.              |
| <b>Q14</b> | Your product needs a number this SOP has never carried. What do you do with it?                             | Write it nowhere. Name what the decision needs, state that v4.0 does not answer it, and file it as an amendment item for the threshold owner; the row waits or executes the part that is governed. Source: v4.0 Section 14, rule V3; Authority Matrix row "v4.0 threshold changes", CEO decides and the PPC Lead executes and reviews. |

### 11.6 What this ramp cannot certify

Component #44, operator onboarding and certification, is not built; the Cross-Reference Ledger row for #44 records it as due 2026-09-25 and states that it consumes Element 11 from every SOP. Until it exists there is no cross-SOP certification test and no pass mark, and v4.0 carries no threshold for one. Two consequences hold in the meantime. First, the checkpoint holder records each competence in 11.2 to 11.4 as demonstrated or not, per row, and the record is the certification; the aggregate pass mark is a v4.1 amendment item, not a number this SOP sets. Second, this section is written to be consumed whole by #44 when it lands, which is why every competence here traces to a matrix row rather than to a house style: a ramp built on preferences cannot be aggregated with 22 other ramps.

## 12. Interface Contracts NEW AT v2.1

**VERDICT:** every handoff into and out of exact campaign operations is an artifact with a named sending owner, a named receiving owner, a stated time, and a stated consequence when it does not arrive. Twenty-four contracts follow, 14 upstream and 10 downstream, drawn from the Cross-Reference Ledger row for component 12 and the rows of every counterparty that names #12, with artifact names and tab locations taken from Master PPC Data Architecture v1.0. The non-arrival clause is the half the corpus has been missing, and its rule is uniform: a handoff that does not arrive suppresses the dependent execution class and is recorded in the T7 Manifest. It never lowers the bar for the decision, and it never authorizes a substitute number.

### 12.1 The five standing contract rules

| ID        | Rule                                                                                                                                                                                                                                                                                                     |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>C1</b> | The artifact is the interface. A verbal handoff, a message, or a recollection does not start a receiving procedure in this SOP. If the artifact is not in its named location, the handoff has not arrived, however confident both parties are.                                                           |
| <b>C2</b> | Non-arrival is recorded, not absorbed. The affected field group is marked in the T7 Manifest with its status, and the manifest column "Verdict Classes Blocked While Missing" states what stops. Source: v4.0 Section 5 "Layer 0: Gates (G1-G12). Nothing Proceeds Until These Pass", gate G8.           |
| <b>C3</b> | Suppression, never substitution. A missing input suppresses its dependent execution class per Section 3. It does not license a smaller version of the action, an estimated input, or a value carried over from a prior cycle without its date.                                                           |
| <b>C4</b> | Cite the Ledger row, not the counterparty's procedure number. Components rebuilt in a later wave move their procedure numbers, so every contract below names its counterparty by component number and the Ledger row that declares its ownership. Where a procedure number appears it is this SOP's own. |
| <b>C5</b> | No contract below carries a maximum lag in hours or days, because v4.0 contains no interface-lag thresholds. The times stated are cadence facts from Master PPC Data Architecture v1.0 Section 12 and this SOP's Section 2 trigger table. A lag limit is a v4.1 amendment item and is listed in 12.4.    |

### 12.2 Upstream contracts: what must arrive before this SOP acts

| ID         | Artifact and where it lands                                                                                                              | Sending owner to receiving owner | Timing                                    | When it does not arrive                                                                                                                                                                                                                                    |
|------------|------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------|-------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>I-1</b> | Raw Pull Pack (BULK-US, 20 sheets) and the refreshed product workbook: A2 deployment state, A7 eligibility, A3 pacing in T3 C3.          | Data Operations to PPC operator  | Pack Monday 06:00; refresh complete 09:00 | T7 marks the field group STALE or MISSING; per G8 the dependent verdicts downgrade to flags; the pass runs on the rows it can read and writes what it could not see. No verdict is issued from a stale deployment state.                                   |
| <b>I-2</b> | Graduation receipt: the #30 graduation log line (term, sources, evidence, outcome, class, family) with the verdict-carried starting bid. | #30 owner to PPC operator        | Same day as the #30 pass                  | No standup. The receipt returns to #30 as incomplete; P1 step 7 bars a bid invented here, so a receipt without its bid cannot be executed at all. The term keeps running on discovery economics and the miss is logged against the pass, not the operator. |
| <b>I-3</b> | Stem and phrase graduation packets and S-R12 receipts, per the Ledger row for #13.                                                       | #13 owner to PPC operator        | Same day                                  | As I-2. A stem that graduates without its packet has no evidence line, and the exact would be stood up on an unvalidated root.                                                                                                                             |

|      |                                                                                                                                                                                               |                                                                             |                                                |                                                                                                                                                                                                                                                                                           |
|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------|------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| I-4  | Head-term receipt carrying ADD EXACT + RESTRUCTURE, per the Ledger row for #15, which registers this interface with its own non-arrival consequence.                                          | #15 owner to PPC operator                                                   | Same day on arrival, outside the weekly rhythm | The head term stays carried by campaigns that choose their own traffic, which is the account's named failure class. The gap routes same day rather than entering the weekly queue.                                                                                                        |
| I-5  | The prescribed wall set for the structure event: levels, sources, and the negation state per source.                                                                                          | #29 owner to PPC operator                                                   | Same working session as the standup            | The standup does not complete. This SOP builds walls, it does not select their level; an over-broad negative built to fill the gap is failure mode F9 and collapses adjacent tail terms.                                                                                                  |
| I-6  | Derived ladder step, placement-CPC exit bid, discovered floor, next step date: T4 columns "Ladder State (step / date)", "Placement-CPC Exit Bid \$", "Discovered Floor \$", "Next Step Date". | #28 owner to PPC operator                                                   | Before each dated step                         | T7 row "B7 Placement splits (TOS/ROS/PP)" reads MISSING and blocks all T4 placement verdicts. The ladder holds at its last dated step; the row is read for gates only. No step is sized in this SOP at any time, so a missing step is a hold, never an estimate.                          |
| I-7  | Funding release with a dated release plus the T2 K7 sizing block: Objective, DSTR, Required clicks/day, Required budget \$/wk, Loss ceiling \$/wk, ETA checkpoint date.                       | Envelope instruments (T0 zone H queue, Account Rollup A2) to PPC operator   | Same day as the release date                   | No standup and no lift. Spend moving toward rank with no funded release is the account's named failure pattern and is shut through the verdict path, not tolerated as a slow push. Per Ledger conflict C3 this contract names the instrument, since no procedural document exists at #31. |
| I-8  | Declared family term owner and assignment basis: Account Rollup A1 Family Boards, "Term owner + assignment basis" columns.                                                                    | #33 owner to PPC operator                                                   | Before any scale action on a shared term       | Gate G11 stays unresolved and no scale action deploys on that term. The row waits for the portfolio call; scaling both siblings while the call is open is the same-term-different-price pattern the family boards exist to catch.                                                         |
| I-9  | Armed-window declaration with its dates, entering T2 with the event flag.                                                                                                                     | #32 owner to PPC operator                                                   | Before the window opens                        | The window is unrecorded, structure changes deploy inside it, and F8 fires: the change reverts unless the event plan names it, and trend exclusions extend from the revert date. The cost is not the change, it is the trend data the window then contaminates.                           |
| I-10 | Launch exit handoff per the launch-to-KDR handoff map: campaign inventory, objective tags, and the honeymoon-guard end date.                                                                  | #22 owner and launch operator to PPC operator                               | At launch exit                                 | The product arrives in the standing cycle with no baseline; the first pass reads it for gates only and stages nothing. A product carried blind through one cycle is cheaper than a cycle of verdicts written against a baseline nobody set.                                               |
| I-11 | SBV go-live date and the paired SP-exact step-down instruction, with the T+1 landed check, per the Ledger row for #17-19.                                                                     | #17-19 owner to PPC operator                                                | Dated to the SBV go-live                       | The SP-exact side holds at its current step. A step-down dated to a go-live that did not happen concedes position and buys nothing, so the absence of the go-live confirmation is itself the instruction.                                                                                 |
| I-12 | Push standup order: the sizing worksheet reference, the achievement condition, and the taper trigger to be logged at standup, per the Ledger row for #23.                                     | #23 owner to PPC operator                                                   | Same day as the funding release                | The standup is incomplete and does not deploy. A push opened without its achievement condition and taper trigger written on day one is failure mode F5 with a delay fuse, which is the account's known failure class.                                                                     |
| I-13 | Incrementality step-down design: the dated step schedule and the measurement window, per the Ledger row for #35.                                                                              | #35 owner to PPC operator, who holds D on this row per the Authority Matrix | Before the first dated step                    | No step deploys. The ladder is not started against an undesigned measurement, because a step-down without a measurement window is a budget cut wearing a test's name.                                                                                                                     |
| I-14 | Recomputed ceilings from the S-A9 sweep with the G9 state (fresh, PROVISIONAL, stale), routed same day, per the Ledger row for #41.                                                           | #41 owner to PPC operator                                                   | Same day as the margin refresh                 | T7 row "D1 Per-variation margin" stays PARTIAL and the PROVISIONAL tag rides every ceiling-referencing action staged this cycle. Ceiling-referencing verdicts still execute, tagged; they are not executed clean on a stale ceiling.                                                      |

### 12.3 Downstream contracts: what this SOP owes, and to whom

| ID   | Artifact and where it lands                                                                                                   | Sending owner to receiving owner | Timing                                                   | When it does not arrive                                                                                                                                                                                                                                                         |
|------|-------------------------------------------------------------------------------------------------------------------------------|----------------------------------|----------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| I-15 | Staged bulk change set in #38 format: entity, prior value, new value, reason string carrying the verdict and the scenario ID. | PPC operator to #38 owner        | Tuesday after the BM huddle; same day on a dated release | The cycle's verdicts do not land. Rows carry forward with their verdicts intact to the next clean cycle and the delay is logged in T6; verdicts are never re-derived to fit a missed window, because a re-derived verdict loses the four-period trend context that produced it. |
| I-16 | The #38 T+1 verification report, consumed back: landed values against staged values.                                          | #38 owner to PPC operator        | T+1 after every deployment, including same-day deploys   | Landed values are unconfirmed, so every read on the affected rows is void for the week and no verdict is issued on them. F10 cannot fire without this report, which makes its absence more expensive than a mismatch inside it.                                                 |

|             |                                                                                                                                                       |                                                                     |                                                                                 |                                                                                                                                                                                                                                |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------|---------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>I-17</b> | The wall list on the new or updated T3 row, as the wall-audit baseline, plus F2 double-buying findings.                                               | PPC operator to #29 owner                                           | Same session as the structure event                                             | The wall audit has no baseline for the new structure and cannot distinguish a missing wall from an unrecorded one. Every later audit on that term produces a finding that costs a session to disprove.                         |
| <b>I-18</b> | Placement evidence held by a consolidation loser, handed over with the consolidation note (P7 step 4).                                                | PPC operator to #28 owner                                           | At consolidation                                                                | The survivor's modifiers are rediscovered from zero, which pays a second time for evidence the account already bought and delays the survivor's ladder by the discovery window.                                                |
| <b>I-19</b> | T6 Decision Log entries with prediction and review date, snapshotted into the KDR Cycle File and rolled to Account Rollup A3 Verification scoreboard. | PPC operator to PPC Lead and Data Operations                        | T6 at deployment; KDR generated Monday PM; A3 after all product workbooks close | Unscored actions do not accumulate, so this SOP's hit rate is unreadable at A3 and a rule performing below the v4.0 review line stays undetected. The missing entry, not the missing result, is what breaks the learning loop. |
| <b>I-20</b> | Budget freed by STOP-LOSS: CONCEDE OR DEFER, returned to the envelope for M5 re-allocation.                                                           | PPC operator to envelope instruments (T0 zone H, Account Rollup A2) | Same cycle as the stop                                                          | Freed budget sits unallocated: the queue under-funds the next push while the envelope reads healthy. This is the quietest failure in the set, because nothing is overspending and nothing alarms.                              |
| <b>I-21</b> | Post-graduation outcome per term, feeding the per-source yield read into T3.                                                                          | PPC operator to #30 owner                                           | At the graduation record's review date                                          | Per-source yields grade the discovery SOPs on graduations whose outcomes are unknown, so a source that produces terms that fail in exact keeps its credit and keeps sending them.                                              |
| <b>I-22</b> | P12 hourly truncation alarms and pacing lines, as the confound list, per the Ledger row for #45.                                                      | PPC operator to #45 owner                                           | Weekly, with the alarm set                                                      | Hour-level claims are read without the confound list, which is precisely the reading the dayparting deferral exists to prevent. Absent the list, a truncation pattern reads as an hour-of-day pattern.                         |
| <b>I-23</b> | The F10 console-edit root cause with the named actor, routed to change control.                                                                       | PPC operator to #37 owner                                           | Same day as the mismatch                                                        | The rule or the actor that produced the edit stays live and the same mismatch returns at the next deployment. The redeploy fixes the value; only this handoff fixes the cause.                                                 |
| <b>I-24</b> | Section 11 of this document, as the ramp content for the certification test, per the Ledger row for #44.                                              | PPC Lead to #44 owner                                               | By 2026-09-25, the Ledger due date for #44                                      | No cross-SOP certification exists. Competence recording stays with the checkpoint holder per 11.6, and the aggregate pass mark stays a v4.1 amendment item rather than a number invented here.                                 |

## 12.4 Repeated non-arrival, and the contracts still owed

**Escalation.** A single non-arrival is a logged suppression. The same interface failing twice in consecutive cycles escalates to the PPC Lead with the T6 history attached, on the Section 7 escalation rule, and is carried to the counterparty as a Ledger-row disagreement rather than settled between operators: a session never edits another component's row.

| Owed                                  | Statement                                                                                                                                                                                                            |
|---------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Interface lag limits</b>           | Every timing in 12.2 and 12.3 is a cadence fact, not a threshold. v4.0 carries no rule that says how late is late. Logged as a v4.1 amendment item.                                                                  |
| <b>A #31 counterparty</b>             | I-7 and I-20 name instruments because no procedural document exists at #31, per Ledger conflict C3. The contract is written to the instrument and will re-point to a procedure if one is built.                      |
| <b>#44 certification</b>              | I-24 has a receiving owner and a due date but no receiving document. The contract stands as written and activates on build.                                                                                          |
| <b>Counterparty procedure numbers</b> | Contracts I-3, I-4, I-11, I-12, I-13, I-14 and I-22 cite Ledger rows rather than counterparty procedure numbers, per rule C4, because those components are at versions later than the copies routed to this session. |

Companions: Master PPC Decision Criteria System v4.0 (all thresholds and verdicts) · PPC Strategic Doctrine v1.0 Sections 3.1, 5, 6 (the why) · SOP-29 Negation, SOP-28 Placement, SOP-30 Harvest, SOP-38 Bulk Mechanics, SOP-31 Envelope, SOP-32 Event Window (boundaries) · Master PPC Data Architecture v1.0 and the Command Workbook READ ME (instrument mechanics) · PPC Authority Matrix v2.0 (Section 11) · PPC Cross-Reference Ledger, row for component 12 (Section 12) · Operations Definition Register (component #12 row).

## Appendix A. Naming Convention

Restated from v4.0 for operator convenience; v4.0 governs. Structure: (Short Brand + Short Product) + Campaign Type + KW/Root/Auto + SV Type + Match Type + Objective + Bidding Strategy + SKU + Audience (optional). The objective and match-type segments must parse for the audit filters; Class 2 campaigns place the family root in the keyword position. Worked instance from WE-1: DBS4-SP-bamboo sheets king-HSV-Exact-Rank-Fix-B4-KING-WHITE. Any deviation is the F6 condition and renames ride alone.

## Appendix B. Weekly Pass Operator Card

P3 compressed; the SOP text governs.

1. T0 then T1 before T2, always.
2. Score last cycle's due T6 rows first.
3. OVERSIGHT filter; gates before metrics on every row (G2, G3/K2, G6, G12).
4. Failing gate: execute the gate lever, defer the metric verdict.
5. K9 verdict to Section 5 execution; opposite trends never share an execution.
6. One lever per row per cycle unless the verdict names two.
7. Execute at the named campaign, not across instances.
8. Stage per #38 with verdict + scenario ID; no scenario ID, no deploy.
9. Tuesday deploy after the BM huddle; T+1 verification; mismatch = F10 same day.
10. Every deployed change logs its T6 prediction with a review date.
