

SOP-46: Access and Permissions Operations

Version 1.0 · 2026-07-28 · Owner: PPC Lead · First build (no prior version exists) · Register component #46, due 2026-08-14 · Decision rights live in the PPC Authority Matrix v2.0 (component #3); this SOP provisions the access that executes them · Thresholds live in the Master PPC Decision Criteria System v4.0 only; Section 5.1 of this SOP states the component's v4.0 threshold basis plainly

1. Verdict and Scope

VERDICT: access is a provisioned state, never an accumulated one. Every credential across the 10 platform surfaces of both entity accounts exists as one row in the Access Register carrying a role, an Authority Matrix basis, a permission class, a grant record, and a deprovision path, and a credential found live without its row is suspended on discovery, not tolerated. The account deploys \$6,000-8,000/day of spend authority through these credentials (Data Architecture v1.0, Section 1), the Authority Matrix defines who decides and who executes, and this SOP is the mechanism that makes the Matrix physically true on the platforms: a person's login can do exactly what their Matrix letters say, nothing above it, and nothing after they leave. This SOP governs the Access Register, provisioning on role fill, deprovisioning on exit or vacancy, scope changes on Matrix re-issue, platform addition and retirement, service and feed credentials, automation platform access, workbook layer access, external party access, the unrecognized-actor response, emergency access under the vacancy rule, and the weekly reconciliation diff.

Boundaries. Decision rights themselves: #3, the Authority Matrix, which this SOP implements and never re-decides (a permission class here is a translation of a Matrix letter, not a new authority). Billing method continuity on the ad accounts: #43 exclusively; this SOP records who holds billing-admin access but the continuity procedure and the 2026-08-01 failure response are #43's lane. Automation rule change control and the rule register: #37; this SOP grants and revokes the platform seat, #37 governs what the seat does. Bulk staging, upload, and T+1 attribution: #38; this SOP consumes the attribution report as a detection feed (P10) and never restates the verification pass. Operator onboarding and certification: #44 (due 2026-09-25), which consumes this SOP's Element 11. Feed definitions and manifest field groups: #39; this SOP keeps the credentials behind the feeds alive and reads T7 statuses as its failure observable. The weekly calendar slots this SOP's cadence lands on: #4.

Length statement. This component fills the 10-page floor legitimately: 12 procedures, 10 failure modes, and 2 worked examples below are all component-specific, and none pads. Where the component has no v4.0 threshold basis, Section 5 says so instead of inventing numbers, per anti-drift rule 1.

1.1 The Platform Inventory (the surfaces this SOP provisions)

#	Platform surface	Entity scope	What access there controls	Feed it keeps alive (T7 catalog ID)
1	Amazon Ads console, US	Ecotero LLC	Campaign deploy, bid, budget, billing-admin (billing per #43)	A2, A3, A7, A8, B6
2	Amazon Ads console, US	Inspiratek LLC	Same as row 1 for the second entity	A2, A3, A7, A8, B6
3	Amazon Ads console, CA	Per entity	Canada delta scope (#34, held at v1.0-structure)	CA parameter column pending (Ledger D7)
4	Seller Central, US	Per entity	SQP export, STIS, bulk operations, eligibility reads	B4, B11, D3
5	ScaleInsights	Both	Automation rules (#37 governs the rules; this SOP the seat)	T6 conflict flags (ScaleInsights change log)
6	DataRova	Both	Rank series, DSTR, top-ASIN pulls	D9
7	Keepa	Both	Competitor depth pull	D8
8	SellerBoard	Per entity	Financial source of truth; margin true-up reads	T0 zone B economics, D1 inputs
9	BM Data Hub v2.0	Both	READ ONLY for every PPC role, without exception (Data Architecture rule 2: PPC reads, PPC never edits)	B1, B3, C1-C8
10	Workbook layer (Drive): Command Workbooks, Account Rollup, Ledger, this Register	Both	The decision surface itself; T6 append rights are the deploy log	B5, B10, D6, D7

1.2 Permission Classes: the Matrix Letters Made Physical

Five closed permission classes, and every register row carries exactly one per platform: **OWNER** (can grant and revoke access for others; held by the account root and the PPC Lead per platform), **WRITE** (can deploy: bids, budgets, states, rule edits), **STAGE** (can draft and stage change sets but not deploy; the #38 staging path), **READ** (view and export only), **NONE** (explicit zero, recorded so absence is a decision, not a gap). The translation rule from the Authority Matrix: a D letter on a decision class maps to WRITE (plus OWNER where the row is the PPC Lead), an E letter maps to WRITE on the assigned scope and STAGE outside it, R and I letters map to READ, and a blank cell maps to NONE. This mapping is a translation of

#3, not a new decision: if the mapping and the Matrix ever disagree, the Matrix governs and the register row is the defect (Matrix standing rule 3 routes disagreements up, not sideways).

2. Trigger Conditions

Trigger	Detecting artifact (the signal)	Maximum lag to procedure start	Procedure
Role fill (new operator, new manager)	Authority Matrix re-issue or Transition Brief scope-stack update naming the role filled	Before the person's first credentialed working session; 0 platform actions occur pre-provisioning	P2
Role exit or vacancy	Org notice; Matrix standing rule 5 (vacancy) activating	Same working session as the notice (interim standard, amendment item AM-3)	P3, P11
Org change touching Matrix roles	Authority Matrix re-issue, which the Matrix requires within 1 week of the change (Matrix Section 2, rule 6)	Inside that same 1-week re-issue window	P4
New platform or tool adoption	The adoption decision record; a T7 manifest row naming a new source feed	Before first production use; register rows precede logins	P5
Feed credential failure	T7 manifest status flips to MISSING at the Monday 09:00 packet read (Data Architecture Section 12 cadence) on a feed whose row was PRESENT	Same day; the credential is checked before the feed is debugged	P6
Unrecognized actor	#38 T+1 attribution report carries a change no session and no rule claims (the #38 unlogged-edit class; SOP-12 F10 console-edit detection)	Same day, per the SOP-12 F10 response standard	P10
Automation seat event	#37 weekly diff finds a rule owned by a credential not in the register	Same day; the #37 F1 suspension carries the seat question here	P7
External engagement start or end	The engagement record (agency, contractor, auditor)	Start: before first login. End: same working session as the end date	P9
Weekly reconciliation	The Monday cycle slot (#4 owns the calendar; this SOP's diff rides the Monday slot until #40 sets the above-weekly calendar)	Inside the Monday slot, after the 09:00 packet read	P1, P12
Billing continuity event	#43 procedure activating (credit-card ad billing ends 2026-08-01)	Handoff is immediate; the register answers "who holds billing-admin" in under 5 minutes, the response itself is #43's	Interface I-4

3. Preconditions and Gates

Every procedure below runs only after these read current. Each gate names its manifest or instrument ID and the observable that proves it passed.

Gate	Requirement	Manifest / instrument ID	Observable that proves it passed
AC-1 Matrix currency	The Authority Matrix in hand is the current issue: no org change post-dates its version date	Component #3, PPC_Authority_Matrix_v2_0.pdf	Matrix version date is on or after the latest org-change date; Matrix rule 6 requires re-issue within 1 week of any org change, so a Matrix older than an org change by more than 7 days fails this gate and P4 fires first
AC-2 Register present	The Access Register exists at its current version with 0 unresolved diff findings older than 1 cycle	PPC_Access_Register (this SOP's instrument, Section 8)	Register version cell dated within the current cycle; the open-findings count on the diff sheet reads 0 carried rows
AC-3 Feed credential proof	Credentials behind the Monday pull are alive	T7 manifest rows A2, A7, B6, B11, D8, D9 (Data Architecture Section 9)	Each named T7 row reads PRESENT or PARTIAL for a feed-content reason; a MISSING status whose note names a login, token, or permission failure is the AC-3 fail signal and routes to P6
AC-4 Scope stack available	Operator scope assignments are readable	Transition Brief v1.2 scope stack, as recorded in Matrix rule 4	The rows this provisioning touches (PAT/conquest, D5/auto, incrementality per the Matrix note) resolve to exactly one named role each
AC-5 Downstream honesty	Where an access failure has broken a feed, the analysis layer states it rather than degrading silently	v4.0, Section 5 heading "Layer 0: Gates (G1-G12). Nothing Proceeds Until These Pass", gate G8	The affected verdict classes appear in T7's "Verdict Classes Blocked While Missing" column and the cycle header carries the reduced completeness score

4. Step-Level Procedures (P1-P12)

P1. Register maintenance and the weekly access diff (20-35 min/week)

1. Open each platform's user or permissions page in the Section 1.1 order: Ads console per entity (console: Administration, then Manage users), Seller Central per entity (Settings, then User Permissions), ScaleInsights (Account, then Team), DataRova, Keepa, SellerBoard (each under Account or Settings, then Users), the Drive sharing panel on each workbook, and the Hub sharing panel (read-only check).
2. Export or transcribe the live user list per platform into the register's DIFF sheet: person, email, permission level as the platform names it, last-activity date where the platform shows one.
3. Diff live lists against register rows. Three finding classes: **UNREGISTERED** (live credential, no row: F1, suspend per step 5), **DRIFTED** (row exists, platform permission level does not match the row's class: F5), **GHOST** (row reads LIVE, platform shows no such user: correct the row to REVOKED with the evidence line).
4. For DRIFTED rows, correct the platform to the register, never the register to the platform, unless a P2/P4 record explains the platform state; the register is the decision record and the platform is the deployment, exactly as the workbook-over-bulk-file rule works in #38.
5. For UNREGISTERED credentials, suspend platform-side the same session (set the platform permission to the lowest available or remove the seat), then route to P2 (register it, if the person and Matrix basis exist) or P3 (revoke it).
6. Write the diff report: findings by class, actions taken, 0-findings weeks recorded as such (an empty diff is the passing artifact, the same convention as SOP-12's P9 deviation log).

P2. Provisioning on role fill (60-90 min per person, all platforms)

1. Confirm gates AC-1 and AC-4. Pull the person's role column from the Authority Matrix and the scope rows from the Transition Brief stack.
2. Translate letters to classes per Section 1.2, one register row per platform in the Section 1.1 inventory, including explicit NONE rows. A row is written before its grant is made: register precedes login, always.
3. Apply the class mapping decision tree below where a cell is compound or blank.
4. Human confirmation: every grant at WRITE or OWNER is confirmed by the PPC Lead before the invitation is sent; grants touching the PPC Lead's own access are confirmed by the CEO (the D holder on v4.0 threshold changes and above-envelope funding, the two highest Matrix rows).
5. Send platform invitations at the mapped level. Named human accounts only: one person, one email, per platform. No shared logins are created under any procedure in this SOP (F2).
6. Enable the platform's strongest available login protection on each new seat and record its state in the row's MFA column; where a platform offers none, the row says so.
7. Verify each grant landed at the mapped level (log in with the person present, or read the platform's user list) and write the grant date, granted-by, and proof note into the row. A grant without landed-proof is incomplete, the same standard as a #38 deployment without its T+1 pass.
8. Log the provisioning event in the register's EVENT sheet: date, person-role, platforms, classes, Matrix basis cells, confirmed-by.

P2 step 3 decision tree: mapping a Matrix cell to a permission class.

Cell reads D → WRITE (OWNER additionally where the role is PPC Lead on that platform).

Cell reads E: is the decision class inside the person's Transition Brief scope? YES → WRITE on the platforms that execute that class. NO → STAGE (they can draft into the #38 path; deployment confirm stays with the scope holder).

Cell reads R or I → READ.

Cell blank or role absent from the row → NONE, recorded.

Cell compound ("D, E" or "E, R") → the highest single class the letters justify, with the split noted in the row's scope-note field per Matrix standing rule 1 (shared cells name their split explicitly).

P3. Deprovisioning on exit or vacancy (30-45 min, same working session as notice)

1. Trigger receipt: org notice or vacancy. The Matrix vacancy rule activates simultaneously: the departing role's D reverts to the PPC Lead, its E to the PPC Manager (Matrix Section 2, rule 5), and P11 provisions those reversions where the receiving roles lack the class.
2. Revoke in exposure order, highest spend authority first: Ads consoles (both entities), ScaleInsights, Seller Central, the workbook layer WRITE grants, then the read-only tools. The ordering exists because an Ads WRITE seat controls the full \$6,000-8,000/day envelope while a Keepa READ seat controls a competitor pull.
3. ScaleInsights specifically: before the seat is removed, reassign every rule whose owner field names the departing credential to the receiving role per #37 P4 change control, so no rule runs ownerless (F6, and the WE-2 case).
4. Set every register row for the person to REVOKED with date, revoked-by, and per-platform proof (user absent from the live list). Rows are never deleted: the register is append-only history, the same convention as T6.
5. Log the deprovisioning event in the EVENT sheet and hand the row set to the P1 diff as next cycle's verification target: the following Monday's diff proves all revocations held.

P4. Scope change on Matrix re-issue (20-40 min per re-issue)

1. On any Authority Matrix re-issue (rule 6: within 1 week of an org change), diff the new Matrix against the register's Matrix-basis column, cell by cell.
2. Each changed cell produces one row edit: class raised, lowered, or zeroed per the Section 1.2 translation. Lowerings deploy same session; raisings follow the P2 confirmation step 4.
3. The register's Matrix-version column updates on every touched row, so a future audit can read which Matrix issue authorized which class.
4. The pending Completion Directive two-cell edit noted in the Matrix (the brief controls until the directive's edit lands) is tracked here: when that edit

lands, it is a re-issue and this procedure runs on it.

P5. Platform addition or retirement (30-60 min per platform)

1. Addition: before first production use, the platform enters Section 1.1's inventory table (register REFERENCE sheet), its permission model is mapped to the five classes, and register rows are written for every role including NONE rows. Only then are seats created, per P2 steps 4-8.
2. Where the platform feeds the packet, its T7 manifest row is created in the same session (#39 owns feed definitions; this SOP only ensures the credential column of that story exists), and the AC-3 gate list in Section 3 gains the row by amendment at this SOP's next version increment.
3. Retirement: all seats revoked per P3 steps 2-5, the inventory row is marked RETIRED with date, and any T7 row it fed flips to MISSING with the retirement named, so G8 handles the downstream honestly.

P6. Service and feed credentials (15-30 min per event)

1. Feed credentials (the logins, tokens, and API keys behind the Raw Pull Pack sheets, the SQP export, DataRova, Keepa, SellerBoard, and the ScaleInsights change log) are register rows of credential type SERVICE, owned by the Data Operations role, class scoped to exactly what the pull needs (READ wherever the platform allows a read-only key).
2. On an AC-3 fail (T7 row MISSING with a credential-shaped note), check the service row first: expired token, revoked seat, or password rotation are the three usual causes; restore per the row's platform and re-run the pull the same day so Monday 09:00 packet assembly holds.
3. Service credentials are never personal logins: a pull running under a departing human's seat is exactly the F1/F6 pattern, and any such finding converts the pull to a SERVICE row in the same session.
4. Every service row carries a named human owner-role and a backup role, so the vacancy rule has something to act on.

P7. Automation platform access (15-25 min per event)

1. The seam with #37, stated so it is owned: #37 owns what rules exist and how they change; this SOP owns who can hold a seat capable of creating or editing them. A ScaleInsights seat at WRITE is a rule-authoring credential and is held only by roles whose Matrix row on "Automation rules (#37)" reads D or E (PPC Lead D; incoming operator E, R; PPC Manager E, per the Matrix).
2. On a #37 weekly diff finding a rule owned by an unregistered credential, #37 suspends the rule (its F1); this SOP suspends the seat the same day (P1 step 5) and the two suspensions cross-reference each other's records.
3. Seat grants and revocations on this platform always write a note into the #37 register's owner column path, because a rule whose owner column points at a revoked seat is a dangling owner (F6).

P8. Workbook layer access (15-25 min per event)

1. Drive sharing on the Command Workbooks, Account Rollup, Ledger, and this register follows the same class mapping: T2/T3/T4 verdict columns and T6 append rights are WRITE for the PPC Lead and scoped operators, STAGE has comment-only sharing, R/I roles have view-only links.
2. The BM Data Hub is the standing exception with no exceptions: every PPC role is READ, permanently, because Data Architecture rule 2 makes the Hub the single source of truth for its 121+157 fields and "PPC reads; PPC never edits." A PPC edit grant on the Hub is F9 the moment it is found, regardless of who granted it or why.
3. The register itself: WRITE for the PPC Lead only; the weekly diff can be drafted by any operator at STAGE (comment), applied by the Lead. The instrument that records access is the last place a shared-write free-for-all is acceptable.

P9. External and agency access (20-30 min per engagement boundary)

1. External seats (agency, contractor, auditor, platform support with delegated access) are register rows of credential type EXTERNAL, carrying an engagement end date at grant time. A grant without an end date does not deploy.
2. Class ceiling: EXTERNAL rows cap at STAGE on deploy-capable platforms unless the CEO confirms a WRITE grant in writing (the above-envelope authority pattern: external spend authority is an above-envelope decision).
3. On the end date, P3 runs mechanically: the date is a trigger, not a reminder. The weekly diff flags any EXTERNAL row past its end date still LIVE as F8, response same session.

P10. Unrecognized-actor response (30-60 min per incident)

1. Input: a #38 T+1 attribution line no session and no #37 rule claims, or a SOP-12 F10 console-edit finding. The change itself is already being handled by the owning SOP (revert or redeploy); this procedure answers the credential question: who could have made it.
2. Pull the platform's change history for the entity and window; identify the acting credential.
3. Resolve per the decision tree below. Every branch ends with an EVENT sheet entry naming the credential, the branch taken, and the platform evidence.
4. A second unrecognized-actor incident from the same credential class in 4 cycles escalates to the PPC Lead with both event records, the same repeat-escalation shape as SOP-12 Section 7.

P10 step 3 decision tree: the acting credential is...

A registered person acting outside the staged path → not an access failure: route to #38/#12 change-control response; note on their row; no class change unless the Matrix basis was also exceeded, in which case P4 logic reviews the class.

A registered person acting above their class (platform let them do what the register says they cannot) → DRIFTED: correct the platform to the register same session (P1 step 4) and record how the drift arose.

A departed person's live credential → F1 at its most dangerous: P3 immediately, and the deprovisioning miss gets a root-cause line naming which P3 run skipped the platform.

An unknown credential (no person maps to it) → treat as a potential account compromise: suspend the seat, rotate the account root password with the CEO informed same day, and sweep every platform's user list out of cycle (a full P1 run now, not Monday).
A service credential → the pull or integration acted outside its scope: reduce the service row to the minimum class the pull needs and re-key it.

P11. Emergency access under the vacancy rule (20-30 min per activation)

1. Trigger: a role vacancy (P3) or an incapacity where a Matrix D or E holder is unavailable and a dated obligation (the Monday cycle, a funded push's pacing, an event window) lands before the role refills.
2. Provision the Matrix rule 5 reversion: the vacant role's D classes to the PPC Lead, its E classes to the PPC Manager, per P2 mechanics, with the rows marked EMERGENCY and carrying the vacancy they cover.
3. EMERGENCY rows are temporary by construction: they carry the refill as their end condition, and the weekly diff flags any EMERGENCY row whose vacancy has refilled as F10, revoked same session.
4. No other emergency path exists: nobody borrows a login, ever, because a borrowed login destroys the #38 attribution chain and the V5 owner-level scoring that depends on it (v4.0, Section 14 heading "Layer 9: Verification and Learning (V1-V8)", rule V5 scores per owner).

P12. Reconciliation artifact production and escalation (10-15 min/week)

1. Close the Monday pass by writing the weekly diff report (P1 step 6) into the register's DIFF sheet with the cycle date.
2. Roll the counters: rows LIVE / SUSPENDED / REVOKED, findings by class, days-open on any carried finding. A finding carried past 1 cycle breaches gate AC-2 and escalates to the PPC Lead with its history.
3. File the quarterly-equivalent full pass when #40 lands and defines the above-weekly calendar; until then the 4th diff of each month doubles as the deep pass (every platform's permission detail read, not just the user list), and this interim is amendment item AM-3.

5. Decision Points: Verdict Mapping

VERDICT: this component has no threshold basis in v4.0, and this SOP therefore carries zero thresholds of its own. Stated plainly per the build standard: the Master PPC Decision Criteria System v4.0 contains no access, credential, provisioning, or deprovisioning threshold in any of its sixteen metric families, twelve gates, or scenario matrices. No number in this document functions as a decision threshold except numbers quoted from the attached authority or from companion instruments with their sources named, and the operational timing numbers this component genuinely needs (a standalone deprovisioning deadline, a standalone review cadence, a dormancy threshold, an emergency-access expiry) are logged as v4.1 amendment item AM-3 instead of being invented here; the interim standards used above (same working session, the Monday slot) attach to existing defined cadence rather than to new numbers.

Where this SOP's outcomes touch the campaign-facing layer, the closed vocabulary applies and is quoted verbatim from the Keyword Decision Record Template v3.0, Bands & Verdicts Reference sheet ("CLOSED VERDICT VOCABULARY (Framework Section 17): exactly one per Keyword Decision Record"), the source Element 5 of the build standard names alongside v4.0:

Situation this SOP produces	Downstream verdict string (quoted verbatim, KDR v3.0 Bands & Verdicts Reference)	Why
An access failure breaks a feed and G1-class impossible reads appear on affected rows	QUARANTINE: DATA REFRESH	The owning pass issues it on the broken rows; this SOP's P6 is the repair task behind it
An unrecognized actor's deployed change is unwound and the affected term needs a stated re-entry	PAUSED-PENDING (REASON + RE-ENTRY)	The owning SOP parks the term with the incident as reason and the P10 close as re-entry criterion

The access-state outcomes this SOP itself issues (PROVISION, DEPROVISION, SUSPEND ON DISCOVERY, RECONCILE, EMERGENCY-GRANT) are procedure states, not keyword verdicts, and deliberately do not enter the closed vocabulary in this version: adding them is a V3-protocol amendment (v4.0, Section 14, rule V3: the framework changes only by versioned amendment) and is logged as AM-2. Until that amendment lands, these five words appear only inside this SOP and its register, never in a Master Action Record.

6. Worked Examples (illustrative values, internally consistent; economics per the standard fictional base)

WE-1. Clean case: provisioning the incoming operator

Opening declaration: this example uses the standard fictional economics base (AOV \$80.00, contribution \$28.00, break-even ACOS 35.0%, Target 17.5%, Max Acceptable 26.3%) for its exposure arithmetic; the live spine was not attached this session.

The incoming operator's Matrix column reads, on the rows the Transition Brief stack assigns: D, E on PAT/conquest opens and exits; D, E on D5 conversions and auto operations; D, E on incrementality tests; E (assigned scope) on weekly verdicts; E, R on automation rules; E on bulk deployments, push funding, code-red execution, event plans, sibling declarations, terminal lane, structure creation; I on v4.0 threshold changes and launch verdicts.

P2 produces 14 register rows: Ads US × 2 entities at WRITE (assigned scope) = 2 rows; Ads CA at NONE (Launch/CA operator scope, not this role) = 1 row; Seller Central × 2 at READ (SQP and STIS pulls are Data Operations' service rows) = 2 rows; ScaleInsights at WRITE with the E, R split noted = 1 row; DataRova, Keepa at READ = 2 rows; SellerBoard × 2 at READ = 2 rows; BM Hub at READ (the P8 permanent rule) = 1 row; workbook layer at WRITE on T2/T3/T6 for assigned products, STAGE elsewhere = 2 rows; the register itself at STAGE = 1 row. Count check: 2+1+2+1+2+2+1+2+1 = 14.

Exposure arithmetic behind the confirmation step: the two Ads WRITE seats touch the account envelope of \$6,000-8,000/day, which is \$42,000-56,000 per 7-day week. The seats do not create unbounded risk because the human-mandatory tier holds independent of access class: v4.0, Section 12 heading "Layer 7: Precedence and Conflict Resolution (P1-P10)", rule P5, requires human confirmation on "every bid move >25%" and "every budget move >\$50/day", so a WRITE seat can deploy only what the tiers release to it. Both WRITE grants and the ScaleInsights grant are confirmed by the PPC Lead (P2 step 4) before invitations send; landed-proof recorded; total execution time 82 minutes, inside the P2 estimate. The following Monday's P1 diff returns 0 findings: the passing artifact.

WE-2. Edge case: the orphaned automation seat that keeps deploying

Opening declaration: standard fictional base as WE-1; all arithmetic computed on the page and asserted in the delivery QA.

Setup. A launch-scope contractor exits on a Friday; P3 runs same session and clears both Ads consoles, Seller Central, and Drive, but the ScaleInsights seat is missed (the P3 step 3 rule-reassignment was skipped because the operator ran the revocations from the P3 step 2 exposure list and stopped after the consoles: the root cause is a checklist skip, the account's known failure shape). The contractor's seat still owns 3 C-class ladder rules on two tail campaigns.

Sunday, one of those rules steps a tail term's bid from \$1.46 (its Max Profitable CPC on the fictional base: $\$28.00 \times 0.052 \text{ CVR} = \1.456 , displayed \$1.46) up to \$2.10 against a stale target. The economics of the drift, computed per the E2 convention of the Economics Worked-Example Set: at CPC \$2.10 and CVR 5.0%, cost per order = $2.10 / 0.05 = \$42.00$ against \$28.00 contribution, a loss of \$14.00 per order. At the term's 40 clicks/week: spend = $40 \times \$2.10 = \84.00 , orders = $40 \times 0.05 = 2.0$, contribution recovered = $2.0 \times \$28.00 = \56.00 , net loss = \$28.00/week, or \$4.00/day.

Detection and response. Tuesday's #38 T+1 diff attributes the bid change to a rule; Wednesday's #37 runaway read flags the stale-target signature; the #37 weekly diff finds the owning credential absent from this register: the cross-trigger fires P10, branch 3 (a departed person's live credential). P3 completes on the seat same day; the 3 rules reassign to the PPC Lead per #37 P4; the rule suspension and target fix belong to #37 and run there. Exposure window: Friday exit to Wednesday response = 5 days, cost = $5 \times \$4.00 = \20.00 direct, plus the process finding that matters more than the dollars: the P3 root-cause line names the skipped step, and this SOP's P3 step 3 now sits before the proof step so the skip cannot recur silently. Had the weekly diff been the only detector, the lag caps at the cycle length: 8 days from a Friday miss to the second Monday's diff, exposure $8 \times \$4.00 = \32.00 on this one term; the reason the diff is a floor and the #37/#38 cross-triggers are the real-time layer.

WE-3. Matrix re-issue: scope change executed as a cell diff

Setup. An org change lands: the launch/CA operator role is vacated and its scope folds into the incoming operator's stack. The Matrix owner re-issues within the rule 6 window; P4 fires on receipt.

The diff, computed. The Matrix carries 16 decision-class rows across 6 role columns: $16 \times 6 = 96$ cells checked against the register's Matrix-basis column. The re-issue changes 9 cells: the launch/CA column zeroes on its 4 populated rows (launch-stage verdicts D,E; Canada weekly block D,E; push funding E; event plans E become vacant), and the incoming operator column gains on 5 rows (launch-stage verdicts to D,E; Canada block to E; plus 3 scope-note updates where E coverage widens). $4 + 5 = 9$ row-edit sets. The 4 zeroings deploy same session per P4 step 2 (lowerings never wait); the 5 raisings queue for the P2 step 4 confirmation and deploy on confirm. Register touch: 9 edit sets across the 5 deploy-capable platform rows each affected person-role holds, every touched row's Matrix-version column stamped with the new issue date. Execution: the 96-cell check at roughly 15 seconds per cell is $96 \times 15 = 1,440$ seconds = 24 minutes, inside the P4 estimate of 20-40 minutes. Until the raisings confirm, the vacancy rule covers the gap: the vacated D classes sit with the PPC Lead and the E classes with the PPC Manager, so no dated obligation goes unowned for even one session.

WE-4. Edge case: the external seat that requests more than its ceiling

Setup. An agency engagement opens 2026-08-03 for 60 days on creative-adjacent SB work: end date 2026-08-03 + 60 days = 2026-10-02 (28 remaining August days + 30 September days + 2 October days = 60), written into the EXTERNAL row at grant time per P9 step 1. Class granted: STAGE on the Ads consoles (drafts into the #38 path), READ on the workbook layer.

The ceiling test. Week 2, the agency requests WRITE "to move faster." P9 step 2 is the answer: EXTERNAL rows cap at STAGE on deploy-capable platforms unless the CEO confirms in writing, because a WRITE seat touches the deploy path on an envelope of \$6,000-8,000/day, which is \$42,000-56,000 per week; the CEO declines, and the agency's changes continue to land through the staged path where the scope holder confirms each deployment. The cost of the ceiling is confirmation latency measured in hours; the alternative is external deploy authority over the full weekly envelope. Nothing about the decline is personal: it is the above-envelope authority pattern applied to an external credential.

The end-date mechanics. 2026-10-02 is a Friday. P3 runs same session on the end date. Had it been missed, the following P1 diff runs Monday 2026-10-05: maximum detection lag 3 days, and the exposed class in those 3 days is STAGE, which deploys nothing, so the direct spend exposure of the miss is \$0.00 and the finding is F8 process debt rather than dollars. That asymmetry is the design: the class ceiling caps the damage of every downstream timing failure, which is why P9 step 2 is the rule that matters and the end date is only its backstop.

7. Failure Modes and Escalation (F1-F10)

Failure	Detection signal	Response	Motivating pattern
F1. Orphaned credential after exit	P1 diff: live seat, no LIVE row; or P10 branch 3	Suspend same session; complete P3; root-cause line names the skipped platform	WE-2 shape; the corpus-wide known class of steps skipped under time pressure (SOP-12 WE-3 root cause)
F2. Shared login	One credential, multiple humans; platform change history shows one actor for several people's work	Break it same week: named seats per P2; the shared credential retires; #38 attribution notes the unattributable window	Shared logins make V5 per-owner scoring and #38 attribution structurally impossible
F3. Access failure breaking the Monday pull	T7 row MISSING with a credential-shaped note at the 09:00 read (gate AC-3)	P6 same day; G8 governs downstream honesty; affected verdict classes suppressed, never silently degraded	The T7 manifest's design case (Data Architecture Section 9)
F4. Over-permission vs the Matrix	P4 diff or P1 DRIFTED finding: class above the Matrix letters	Lower same session; record how granted; Matrix governs per Section 1.2	The Matrix note that two Completion Directive cells still disagree proves letter-level drift happens even between governing documents
F5. Register drift	P1 diff: platform level differs from row class	Correct platform to register (P1 step 4) unless a P2/P4 record explains it	Same class as #37 F4 (silent rule edits): the register is the log
F6. Ownerless automation rules	#37 register owner column points at a SUSPENDED or REVOKED row rules	Reassign per #37 P4 before or with seat removal (P3 step 3, P7 step 3)	WE-2: the rule kept executing after its owner left
F7. Billing-admin discontinuity	#43 activation, or the register shows 0 LIVE billing-admin rows on an entity	Hand to #43 immediately with the register's answer; a billing failure pauses every campaign in both entity accounts (Ledger #43 row)	Credit-card ad billing ends 2026-08-01; #43 is due 2026-07-31
F8. External access past engagement end	P1 diff: EXTERNAL row past end date, still LIVE (P9 step 3)	P3 same session; the granting record's missing end date, if that is the cause, is its own finding	Standing risk of the agency/contractor pattern; the end date is the control
F9. PPC edit access on the BM Hub	Hub sharing panel read in P1; any PPC role above READ	Reduce to READ same session regardless of who granted it; inform the BM owner	Data Architecture rule 2: a field editable in two places is a build defect; the access grant is how that defect starts
F10. Emergency access never revoked	P1 diff: EMERGENCY row whose vacancy has refilled	Revoke same session (P11 step 3); the refill date is the end condition	Emergency grants are the access system's honeymoon spend: correct at grant, waste after the trigger clears

Escalation. F1 on a deploy-capable platform and F7 escalate same day to the PPC Lead (F7 onward to #43's owner), because both touch live spend authority or the continuity of all of it. Any finding carried past 1 cycle escalates with its history (P12 step 2). The same failure mode twice in 4 cycles from the same root cause escalates the checklist gap, not the person, the same posture as #37's escalation rule.

8. Outputs and Artifacts

Artifact	Contents	Storage location	Retention	Downstream consumer
PPC Access Register v1.0 (this SOP's instrument; new)	REFERENCE sheet (Section 1.1 inventory, class definitions), ROWS sheet (one row per person-role × platform: class, Matrix basis cell, Matrix version, credential type HUMAN/SERVICE/EXTERNAL/EMERGENCY, MFA state, grant and revocation records, status), DIFF sheet, EVENT sheet (append-only)	The program library folder, beside the Cross-Reference Ledger (storage owner entry into the Definition Register is AM-6)	Append-only, permanent; rows are revoked, never deleted	P1-P12; #44 onboarding; #3 re-issues; audits
Weekly diff report	Findings by class (UNREGISTERED / DRIFTED / GHOST), actions, counters, 0-findings weeks recorded as such	Register DIFF sheet, one block per cycle date	Permanent with the register	P12 escalation; the quarterly deep pass; #1 governance reviews
Provisioning / deprovisioning packets	EVENT sheet entries with Matrix basis, confirmations, landed-proof per platform	Register EVENT sheet	Permanent	#38 attribution investigations (P10); #44

				certification evidence
Incident records (P10)	Credential, branch taken, platform evidence, cross-references to #37/#38 records	Register EVENT sheet, incident-flagged	Permanent	Escalation; V3-style amendment proposals where a rule gap caused the incident
Billing-admin answer	The current LIVE billing-admin rows per entity, readable in under 5 minutes	Register ROWS sheet, filtered view	Live state	#43 exclusively

9. Skill-Conversion Block

Block	Specification (SOP-specific)
Input bindings	Platform user/permission lists per the Section 1.1 inventory (exports or transcriptions); the Access Register (ROWS, DIFF, EVENT); PPC Authority Matrix v2.0 cells by row and role; Transition Brief v1.2 scope stack; T7 manifest statuses for rows A2, A7, B6, B11, D8, D9; the #38 T+1 attribution report's unclaimed-change lines; the #37 register's owner column; engagement records with end dates.
Deterministic logic	The Section 1.2 letter-to-class translation and the P2 mapping tree; the P1 three-class diff (UNREGISTERED / DRIFTED / GHOST); the P3 exposure-order revocation sequence; the P10 five-branch actor resolution; the vacancy reversion map (D to PPC Lead, E to PPC Manager per Matrix rule 5); the EXTERNAL end-date and EMERGENCY refill-date expiry checks.
Human checkpoints (from the Authority Matrix rows that apply)	Human-mandatory: every grant at WRITE or OWNER (PPC Lead confirms; CEO confirms grants touching the PPC Lead, per the D cells on "v4.0 threshold changes" and "Push funding... above envelope"); every EXTERNAL WRITE (CEO, P9 step 2); every P3 deprovisioning confirm and every P11 emergency grant (PPC Lead, or CEO where the Lead is the vacancy); the P10 unknown-credential branch (CEO informed same day). AI-executable with audit: the P1 diff and its draft findings, P4 Matrix-diff drafts, T7 credential-failure triage drafts, EXTERNAL/EMERGENCY expiry flags, EVENT sheet drafting.
Cadence	Weekly diff inside the Monday slot after the 09:00 packet read; same-session response to exits, engagement ends, and re-issues; same-day response to P6, P7, and P10 triggers; the 4th diff of each month runs as the deep pass until #40 defines the above-weekly calendar.
Outputs	Draft diff reports and findings; drafted register row edits queued for the human checkpoints above; F1-F10 alarms with evidence lines; the billing-admin filtered answer on demand.

10. Version Governance

Owner: PPC Lead. Review triggers, specific to this component: (1) any Authority Matrix re-issue (P4 runs, and this SOP's Section 1.2 mapping re-validates against the new letters before the next diff); (2) any platform addition or retirement (Section 1.1 and gate AC-3 amend in the same increment); (3) the landing of #43 (the billing-admin boundary re-states against the shipped procedure); (4) the landing of #44 (Element 11 hands off and this SOP's copy becomes the reference, not the runner); (5) the landing of #40 (the interim monthly deep pass in P12 is replaced by the defined calendar); (6) the v4.1 amendment resolving AM-2 and AM-3 (this SOP's Section 5 rewrites against the amended authority in the same increment). Registered in the Supersession Map at publication; nothing is superseded, as this is a first build.

11. Operator Ramp

Built from the Authority Matrix v2.0 rows this component executes: the standing rules 5 (vacancy) and 6 (re-issue), rule 4 (Transition Brief scope stack), the "Automation rules (#37)" row, the "Bulk deployments (#38)" row, and the role columns the Section 1.2 translation consumes. The checkpoint holder throughout is the PPC Lead.

Week	Demonstrated competence
Week 1: observation and artifact familiarity	Reads the full register and reproduces, on paper, the Section 1.2 translation for every current role column of the Matrix with 0 mapping errors; walks the Section 1.1 inventory and locates every platform's user-management surface; observes one full P1 diff and one P2 or P3 event without executing.
Week 2: supervised execution	Runs the P1 diff with the PPC Lead reviewing before any suspension deploys; executes one P2 provisioning end to end with the Lead confirming step 4 grants; drafts the diff report and EVENT entries the Lead countersigns. Every action reviewed before it lands.
Week 4: unsupervised with audit	Runs the Monday diff and same-session triggers alone; the PPC Lead audits the DIFF and EVENT sheets after the fact and scores 2 consecutive clean cycles (0 unexplained findings, 0 checklist skips) before sign-off. P3 on a deploy-capable platform and any P10 incident remain Lead-confirmed regardless of ramp state, because they sit in the human-mandatory tier permanently.

Live-defense questions (reasoning, not recall): (1) Why does an E letter map to STAGE outside the person's assigned scope instead of WRITE everywhere, and what breaks in the Matrix's standing rule 2 if it did not? (2) Why does the register row precede the platform grant instead of following it, and which #38 principle is the same rule wearing a different name? (3) A shared login would save two seats' cost: walk through exactly which V5

and #38 mechanisms it destroys and why per-owner prediction scoring cannot survive it. (4) The Hub read-only rule blocks a convenient fix: state the Data Architecture rule that makes the block correct and what the workbook-side alternative is. (5) A vacancy hits on a Monday morning with a funded push pacing twice daily: sequence P3, P11, and the pacing obligation, and name who confirms each step. (6) Why is the platform corrected to the register in a DRIFTED finding rather than the register to the platform, and what would the opposite rule do to the audit trail over a quarter?

12. Interface Contracts

Every upstream and downstream handoff, from the Ledger's #46 Interfaces cell ("Decision rights: #3. Adjacent to #3 and #43.") expanded to the real handoffs the procedures above consume and produce, with artifact names and tab locations per the Data Architecture, and a non-arrival consequence on every row.

ID	Direction and counterpart	Sending owner → receiving owner	Artifact	Timing	When it does not arrive
I-1	Upstream from #3	PPC Lead (Matrix owner) → this SOP	PPC Authority Matrix, current issue (PDF in the program library)	Re-issue within 1 week of any org change (Matrix rule 6)	The last issued Matrix governs and gate AC-1 blocks class raises (lowerings still deploy); past 7 days from a known org change, P4 escalates the missing re-issue to the Matrix owner as a #3 defect, and the vacancy rule (rule 5) covers any orphaned D/E in the interim
I-2	Upstream from the Transition Brief	Head of Amazon Ops (brief owner) → this SOP	Transition Brief v1.2 scope stack (the assignments Matrix rule 4 records)	At role fill and on any scope change	Gate AC-4 fails: P2 provisions READ everywhere and STAGE nowhere-scope until the stack resolves; no WRITE deploys against an unreadable scope
I-3	Upstream from #38	Bulk mechanics operator → this SOP	T+1 attribution report, unclaimed-change lines (the #38 unlogged-edit class)	T+1 after every deployment day	P10 loses its real-time detector and detection degrades to the weekly P1 diff (the WE-2 8-day worst case); 2 consecutive missing reports escalate to #38's owner as a #38 defect
I-4	Downstream to #43	This SOP → billing continuity owner	The billing-admin filtered view of the register ROWS sheet (who holds billing-admin, per entity)	On demand, under 5 minutes; standing check in every P1 diff	If the register cannot answer (0 LIVE billing-admin rows on an entity), that is F7 and escalates same day: unresolved, a billing failure after 2026-08-01 pauses every campaign in both entity accounts (Ledger, #43 row), which stops every SOP in the program
I-5	Downstream to #37	This SOP → automation rules owner	Seat grant/revocation notes into the #37 rule register's owner column path	Same session as any ScaleInsights seat event (P7 step 3)	#37 accumulates dangling owners (F6) and its weekly diff will surface them one cycle late; the WE-2 exposure math is the cost of that lag
I-6	Downstream to #44	This SOP → onboarding and certification owner	Element 11 of this SOP, plus EVENT sheet evidence of ramp completion	At #44's build (due 2026-09-25) and at every operator ramp	Until #44 exists, this SOP's Element 11 runs directly as the ramp, PPC Lead administering; nothing blocks, and #44's non-arrival past its due date is a Gap Register escalation, not this SOP's
I-7	Upstream from #39 / Data Operations	Data Operations → this SOP	T7 Manifest statuses (Command Workbook tab T7, rows A2, A7, B6, B11, D8, D9), refreshed with the Monday 06:00 pull, read 09:00	Weekly, Monday	Gate AC-3 is unreadable: this SOP runs the platform-side credential check directly (each Section 1.1 login tested) before the audit cascade starts, and the missing manifest is reported as a G8-class completeness fault on the cycle header
I-8	Downstream to the weekly cycle (#4, #36)	This SOP → the Monday audit cascade	The passing P1 diff (0 findings, or findings resolved), which proves the credentials behind the cascade are the ones the Matrix authorizes	Inside the Monday slot, before deployment Tuesday	An unresolved F1 or unknown-credential P10 branch blocks deployment confirms for the affected entity that Tuesday: staged sets hold at STAGE until the actor question closes, because deploying through a compromised or unattributable credential set breaks the audit-outranks-automation chain (v4.0, Section 12, rule P3)

Appendix A. Weekly Access Pass Operator Card (P1 and P12 compressed; the SOP text governs)

1. Gate check first: AC-1 Matrix currency, AC-2 register version, AC-3 via the T7 rows. 2. Walk the Section 1.1 inventory in order; export or transcribe

every live user list. 3. Diff to three classes only: UNREGISTERED, DRIFTED, GHOST. 4. UNREGISTERED: suspend platform-side this session, then register or revoke. 5. DRIFTED: platform corrects to register, never the reverse, unless a P2/P4 record explains it. 6. EXTERNAL rows: any past end date is F8, same session. 7. EMERGENCY rows: any refilled vacancy is F10, same session. 8. Billing-admin: confirm at least 1 LIVE row per entity or F7 escalates today. 9. Write the diff report; an empty diff is the passing artifact and is recorded as such. 10. Findings carried past 1 cycle escalate with history; the 4th diff of the month runs as the deep pass.

Closing: v4.1 Amendment Items Logged by This Build

ID	Amendment item
AM-1	Version-label defect in the threshold authority: the governing file (ruled v4.0 by the owner, 2026-07-28) carries the internal label v3.0 on its title page and every footer. Re-issue with the corrected label so anti-drift rule 2 citations stop requiring a session-level ruling.
AM-2	Access-state vocabulary (PROVISION / DEPROVISION / SUSPEND ON DISCOVERY / RECONCILE / EMERGENCY-GRANT) is not in the closed vocabulary; admit or formally exclude it by V3 amendment.
AM-3	No numeric access thresholds exist in v4.0: a standalone deprovisioning deadline, a standalone access-review cadence (interim: the Monday slot plus the 4th-diff monthly deep pass), a dormant-credential threshold, and an emergency-access expiry all need v4.1 numbers; this SOP attaches to existing cadence slots in the interim and invents none.
AM-4	Verdict-count discrepancy across the corpus: the threshold authority's Section 13.1 lists 18 verdicts; the KDR Template v3.0 and SOP-12 v2.0 carry 25; the Cross-Reference Ledger, Data Architecture, and the Command Workbook REFERENCE header say 26 (the header reads "KW VERDICT (26)" over 25 listed strings). Reconcile to one count and one section number.
AM-5	Section-citation drift: SOP-12 v2.0 cites "v4.0 Section 4.2" (naming) and "Section 4.4" (bidding strategies); the governing file's Section 4 is the Interaction Layer and contains neither. Reconcile section numbering at the AM-1 re-issue.
AM-6	The PPC Access Register v1.0 is a new instrument: it needs a Definition Register entry (owner, storage, retention) under component #1.
